Feature Server - Voice Routing & Trunk Configuration with Ease by Bernadette Bender

Article published on February 25th 2012 | Business

Axia's Feature Server is the industries market leader providing combined feature server and switch technologies. Deployed throughout North America and abroad, the AAFS500 enables ITSP's and other SIP providers the ability to offer SIP switching with enhanced PBX features delivered by trunk/line.

The software based platform runs within redundant server planes and is sized based on simultaneous user connections. The platform maintains a web based GUI for both resellers and end customers.

Beyond the redundant architecture and interconnected carrier capabilities, the system can connect direct to Axia's EZYBill solution to complete the entire telecommunications carrier platform.

The AAFS500 delivers Centrex style line features plus permissions restrictions, click to dial vm, voicemail-to email, queuing, three way line calling, click conferencing among many more.

â€¢ Class 5 Feature Server

â€¢ Carrier Class Switching Architecture

â€¢ Real-time Unit Failover

â€¢ Hierarchal Trunk Management

â€¢ Username / IP Authentication

â€¢ Easy To Operate Web GUI Administration

â€¢ EZYBill (Telecom Billing) Connection

Hosted PBX phone solutions are revolutionizing how businesses of all sizes support their customers, handle their call flows, and empower their employees. Through Axia's Hosted PBX, customers receive the flexibility and cost savings of PBX call routing and other functions as a hosted service, rather than a complex piece of hardware that you have to buy, install, and maintain.

Axia's Hosted PBX application delivers a complete suite of enhanced PBX functionality over any private IP connectionâ€"without the need for expensive PBX equipment. Easy to manage and feature rich, Axia Hosted PBX gives our customers another tool to increase productivity and streamline their business operations.
