Article published on May 11th 2012 | Travel

Long gone are the days of dial-up internet connections, and wires strewn across a room. We now have the luxury of connecting to the internet at the touch of a button. Wireless internet connections are heavily relied on by those wanting to access their emails and such, whilst on the move. Those with smartphones and iPads can do so on these devices with a Wi-Fi or integrated connection. Technology has come on leaps and bounds in current years, and is a continually thriving market. It is estimated to be worth approximately Â£100bn, and constantly growing. With such huge figures, itâ€™s no wonder why there are so many people and businesses investing time in upgrading their mobile phones, computers and varying updated softwares.

Cab offices stuck using an archaic system, are in need of a revolutionary hardware free solution. Tangled wires are a thing of the past. With a cloud-based taxi dispatch system you neednâ€™t worry. Itâ€™ the answer to many problems that cab offices across the country face. A solution to the disappointment they are experiencing with the functionality of current software. The competitors on the market, with their systems needed to be installed on individual computers are, unfortunately, flawed.

Looking for a more improved and entirely operative system is the task of many cab offices. With the switch in technology, it is important to keep up with the latest developments. A cloud-based taxi dispatch system does exactly that. No set-up and installation required; a web-based, hardware free system is much more appealing to those that want to reduce or eradicate the maintenance required.

Plus, with everything based in the cloud, the updates can be instantly installed this way, reducing the time taken away from accessing the booking function. Each moment spent unable to access the system, is time and money lost. This is not good news to those in the private hire and taxi industry. What they need is constant access to a reliable and regularly updated system - without any inconvenience. With a cloud-based taxi dispatch system, this is possible. There are so many benefits to going hardware free and putting your trust in the competence of a web-based system. Those dubious to the security measures in place, neednâ€™t be. Regular tests are carried out to ensure the safety of such a system and with the regular updates, all avenues are covered. The updates certify that the system is continually modified to have the latest technological developments. An advanced system, such as this, is what your cab office needs to function to a high standard.
