Tips for Those Purchasing UPS Systems by [James Blee](#)

Article published on February 25th 2012 | [Advertising](#)

When you are purchasing UPS systems, there are a few things that you should be particularly careful about. A UPS is an important device and if you are purchasing it, chances are that you cannot afford a power breakdown and would want to have a backup at all times. So, a few simple things should be checked to make sure that your uninterrupted power supply will not let you down in any way. The first thing to determine is the gadgets or appliances which will be on the UPS. You obviously want to purchase a ups system that is adequately powerful to support all those gadgets or home appliances that you actually want to support. Taking the total power rating of those appliances will help you determine the capacity of the UPS you should bring home.

It is important to prefer a ups system which comes with an extended battery option and which can also allow you to increase the total power if you add parallel units. The backup time for the expected load should be calculated properly. Similarly, you should be well aware of what the backup would be when the load is half of what the UPS is rated for. Moreover, the UPS itself should come with a reliable warranty so that you do not end up with a defective piece that does not function as expected.

There are installation guidelines as well for your UPS and you must be well aware of things like power factor, the maximum possible load and kVA load requirements. The make and brand of the UPS is quite important and since you are purchasing something that is present for backup, you should not compromise on its quality. Top manufacturing companies should always be preferred so that not only your device is reliable but you can also take advantage of good service.
