CNG Cylinders: the Best Way to Save Fossil Fuels by [James Blee](#)

Article published on April 25th 2012 | [Business](#)

The world is fast running out of fossil fuelsâ€™ reserves. Coal and petroleum mining have left the earth almost depleted. In such a situation, it is important to come up with alternative sources of energy which can be used to work the thousands and thousands of vehicles that run all over the world. CNG cylinders are very good that way because they hardly cause any environmental misbalance.

CNG cylinders are fitted at the back of the car and the nozzle is fitted to the engine. Any normal car can be made to a CNG run car with just the installation of the gas cylinder. There are registered cng service holders which are set up by government. You take your car to them and your car is registered as CNG cylinders services and the change is made. You can refill your gas cylinder just as you refill your petrol in your car.

All the cylinders are checked thoroughly by experts before dispatch. Cng cylinders have taken a whole new dimension. The valves are double checked for maximum security and safety. They have various types of CNG cylinders and the consumer can order according to their needs after going through their online catalogue. Type 1 CNG cylinders are made of chrome molybdenum steel while both Type 1 and Type 2 are suitable for use for as much as twenty years.

So do opt for CNG cylinders when you are buying a new car or fixing your old car. You will be doing your bit to save the earth and also solve your car related problems. And you will also be playing your part to stop the rapid depletion of the fossil fuels from the face of the earth.
