Dorset Has Been Famous for the Production of Specially Designed Gas Detectors for Boats by [Nereus Alarms](#)

Article published on May 2nd 2012 | [Business](#)

Dorset, a county in South West England, is famous for several reasons that include three huge ports at Poole, Weymouth and Portland, and an international airport at Hurn. It is also the birthplace of two laureates, Thomas Hardy and William Barnes. The economy of this region is largely based upon agriculture, fishing and tourism. The presence of ports allows carrying out international trades, and it is estimated that there are approximately 230 fishing vessels that are involved in catching crabs and lobsters. Interestingly, many people might not know that Dorset has a small industrial area, and it is famous for the production of special gas detectors for boats. You might have heard about gas alarms and detectors that are used generally to protect the people from health related issues arising from inhalation of toxic gases. They also help preventing the occurrence of fire incidences due to accumulation of combustible gases.

It is not sufficient to fix a gas detector in your boat, as you will have to check it at regular intervals to know that it is functioning properly. Check the voltage of the batteries using multimeter, and charge them if they read below 12.5 volts. You should also check the +ve and -ve connectors of the gas detectors that is connected directly to the battery terminals. Repair the loose connections, if required. You can also unplug the connectors, clean them and reconnect them. Besides this, you must ensure that you have read the instruction manual thoroughly, which provides necessary guidelines for the users, and try to follow them.

Most of the gas detector manufacturer focuses on testing the quality of their gadgets in the normal conditions, before passing them to the market place for sales. However, it will be sensible to keep in mind that when you are going to install commonly available gas detectors on boats, they might be prone to wet and moist conditions, which can damage the sensors. If, the sensors are subjected to such conditions, your detector might start raising false alarm, causing great inconvenience. Once damaged, it will cost a lot to repair your gas detector. This is the chief reason that makes it necessary to install specially designed gas detectors for boats, as they are supported by waterproof sensors. Furthermore, they will provide authentic results even in the low energy conditions.

There are different categories of detectors, such as carbon monoxide detector, petrol vapour detector, and LPG detector. You can also choose a combined gas detector for ensuring complete safety of the people on board. The natives of Dorset are privileged to be living in the region which is known for manufacturing and selling of hi-fi gas detectors that are best suited for motorboats, yachts, narrowboats and RIBs. It is hard to find such hi-tech safety devices elsewhere, because there are only few companies that indulge in the production of special gas alarms and detectors for boats and yachts. If, you are concerned about the safety of your vessels and you care for the people who travel along with the crew members, you should not fail to install high-quality gas detectors in each of them. Remember, there are nearly impossible to escape from the adverse conditions while you are in the middle of sea.
