Get various equipments like magnetic separators, sorting plastics from wceknife by [Maxy](#)

Article published on August 3rd 2012 | [Business](#)

Everyone has heard about the recent campaigns that are pushing for recycling. In order to get people on board with this idea it takes both education and processes. Education can come in the form of radio announcements, television commercials, billboards, documentaries, books, magazine articles and presentations. The more information people have about the benefits of these types of programs and campaigns, the more likely they are to do their part and participate. Parents play in big role in the education of their children and the way that the kids view waste and their role in preventing it. Teachers and school administrators also have a critical role in the development of the children's mindsets around this topic. Not only is it important to educate the public about the importance of these programs, it is necessary to have straight forward systems in place that can be easily utilized by the average person with out needing to ask too many questions. Systems include: Recycling equipment, methods for sorting plastics, and Magnetic separator systems.

Recycling equipment may be as simple as colored bins that are labeled with the words plastic, glass, paper, food waste, and metal. This covers the majority of the materials that will accumulate as waste. Recycling equipment can also consist of heavy-duty separators that are normally purchased by big corporations and cities themselves. It is rare for a family to have Recycling equipment in the comfort of their own home, but they can still do their part by separating the recyclables from the rest of the garbage rather than just throwing it all together.

Currently there are some new ways of sorting plastics. One way to know how the process of sorting plastics can happen is by looking at the number on the bottom of the container. The lower the number, the easier this piece is to break down. Pieces that have the numbers one and two can be thrown in with the recyclables at one's house, but numbers higher than that may not be able to be broken down. People can make an effort not to buy plastic that is higher than the number two to be certain that it will later be able to be broken down.

Magnetic separator systems are another example of systems that are not normally found in one's home but rather a large restaurant, or corporation that is using the Magnetic separator systems to sort their garbage and pick out the metal material from the mix of trash. As these systems become more and more common and affordable, our society will be much more likely to recycle and do their part in making the earth a greener place to live.
