Pack almost anything, but with care by [Dion Sivla](#)

Article published on January 27th 2012 | [Business](#)

The main aim of any manufacturing company, either it be a medicines or chemical, or any household edible items manufacturing company, is to give complete satisfaction to the consumer. The consumer must not hesitate in buying their product, it should be so enjoyable, that it should come again to buy it. All this can only be possible if the product made, is reached to the people with the same freshness and taste. Here is the place, where the packaging people play a very important role.

The flexible packaging is in the great demand these days. Most of the products that we see in the market are passed through such type of packaging. The flexible packaging mainly involves plastic, which provides additional support in the safety of the product packed in it. However, such type of usage of plastic is not suitable for all kind of products. Only those products which are long lasting, that are very resistant towards moisture or any such thing are packed in the plastic. The plastic actually develops a vacuum inside the packet, which protects the material from external environmental hazards and gases. However, it is to be mentioned again that it is suitable for very few products only.

Most of the products are sensitive to the temperature, sunlight, and many other unavoidable things. Along with it, products like, tea and coffee releases gases after they are packed. If flexible packaging involving plastic is used then it may cause serious damage to it. For this purpose, foil bags were introduced in the packaging system. Such foil bags are made up of aluminum or surlyn. Using aluminum foil bags have list of advantages. They protect the material from the sunlight and temperature variation. The thickness of foil is too much, and so the material remains very safe inside it. Also, in the packaging of the tea and coffee, it can be used and acts as a best savior. It also inhibits the growth of bacterial and other microbes inside it.

The other type of material that is surlyn is a best moisture controller. It not only maintains the moisture level but also permeable to the gases. Thus, removes all the unwanted gases and allows oxygen in required amount only. With the development of techniques and many other inventions, the new materials are also introduced into the market. All such materials are used in the flexible packaging, and the best results are obtained. All such changes are for the betterment of the human life, and also act as a new shopping experience for the consumers. However, the manufacturers are giving good response to such inventions and so the buyers.
