Silicon Dicing is a Great Business Alternative for You by [James Blee](#)

Article published on March 2nd 2012 | [Business](#)

The people who are aware of the features and the quality of services of diamond dicing, they are also well informed about the increasing demand for silicon dicing. This may take by surprise most of the professionals as still diamond dicing finds more applications. It is known for producing much better results. But, there are also some problems associated with the process of diamond machining. The diamond processing methodology involves high costs, need for extremely professional and skilled labor and other technical infrastructure. These resources are not only difficult to handle but also requires the investors to invest a huge amount of money. The above mentioned disadvantages prompt the users to go for the process of silicon dicing in spite of the many disadvantages in the process of diamond machining. This is a cheap and prospective option for the industrial sectors. The return on investment is considerably high and the businessmen can be sure of making some profits. Thus, this is really a safe business option. With more and more industrialists starting to go for this option, many related businesses are also growing. The sub categories involve quartz, glass, ceramic dicing and others.

silicon wafer dicing also finds applications in stacked and embedded memory applications also. During these operations one of the main problems is that of backside chipping while going for the mechanical sawing. This leads to a considerable reduction in overall yield. To maintain the standards for higher level of yields it is very much essential to control the feed speed of the saw and set it at a lower level. This problem has been solved with the help of introduction of scientific laser sawing. The yield and quality of products in this way is not only good but is also easy to operate. This in turn has another major advantage..
