Some Tips on Buying a Digital Baby Monitor by [Healthhygiene](#)

Article published on May 12th 2012 | [Business](#)

The first thing that you need to know is that a digital baby monitor is not just for infants. Some parents who have children with conditions like seizure disorder, epilepsy, and autism, keep these monitors in their children's rooms so they can keep a check on them but still allow them to be a little independent.

The latest addition to the world of the digital baby monitor is the video baby monitor. These devices not only allow you to hear what is happening in the other room they allow you to see into the room as well. You will have the ability to remotely change the angle at which the camera is pointed so that you can clearly see the part of the room you need to see.

Of course the parents of newborn infants feel the need to have the ability to check on their infant while it is sleeping. The digital baby monitor allows them to place the child in their crib, and then go about doing their chores, secure in the knowledge that if the baby awakens they will hear them over the transmitter, and will be able to go tend to their needs. If you place a video baby monitor in the room of the sleeping infant then the parent can look at the screen occasionally and be certain the child is still sleeping in a safe position. This can prevent accidents where the infant gets tangled in bedding or where the infant might roll into a position that could be dangerous if they were to spit up.

The peace of mind these devices will provide you will be enough to cause you to pay any amount the manufacturers ask for a video baby monitor. Luckily you have many choices in manufacturers of these items and the video baby monitors are no more expensive than the average night out having dinner and going to the movies.

The best baby monitor for older children will depend on the child and the circumstances. For the average child you will not need anything too extreme as all you really want the device for is to ascertain the well being of the child, and you can generally do this from the sounds you hear emitting from the room. If the child has a medical condition like seizure disorder you may want to make sure you have a device that will allow you to view them as well as hear them. These children can often have seizures and aspirate on their own vomit during them. When this happens they could potential be in danger of dying so it is crucial that the parent or caretaker know what is happening with them at all times.

Of course these children are no different from other children. As they get older they want a little more privacy and separation from their parents. This is especially true when they have guests over to play. By installing something like one of the Tomy baby monitors in the room the parent can be sure the child is safe while they explore a little freedom.
