Three types of pool heaters- a comparison by [Canberra Marketing](#)

Article published on December 4th 2011 | [Business](#)

With rising global temperatures, swimming pools are becoming more desirable than ever as objects of entertainment and relaxing. The swimming pool season is relatively short, but with the right solar pool heating system you can lengthen your usage by a few months and get the most out of your swimming pool.

On an online search for a pool heater, you'll find yourself bombarded by many options. Know the correct size of the heater you need, and determine what fuel heater you want. Power efficiency and highest temperature rise are two other factors you must think about when shopping for a pool heater. Many pool heating units use gas as the primary fuel. With fuel costs increasing on a daily basis it's prudent to invest in a high-efficiency solar pool heater so that heating a swimming pool is less expensive. The advantages of a pool heating system fuelled by natural gas or propane are speedy heating capability and added synchronised, constant temperature.

Electric pool heaters offer relaxed temperatures with no hazardous fuels. They are easy to use and don't require much repairs. Unfortunately, they don't heat a pool as quickly as systems fuelled by gas and can be costly due to energy bills.

Solar pool heaters are a newer alternative and they work by moving the water through solar panels that are naturally heated by the sun. A pump works to shift water through the panels and back into the pool. These panels are a highly proficient way to keep an enjoyable temperature.

Most homeowners find a grouping of a gas heating system amplified by a solar system is the best option. The solar pool heater will help keep energy bills down, while the gas heater will provide the swift heating and steady temperature that you desire. With such a wide variety of sizes obtainable, be sure that you pay for a heating system that is the correct size for your pool. Accurately measure your pool's dimensions for this. Read the manuals carefully so as to avoid the hassle of returning the heater. If you have an inground pool, then you'll need that specific type of heater. The same goes for aboveground pools and their heaters.

Irrespective of the fact whether the heating structure you use is gas, electric or solar-powered, your visitors will be in love with the comfort your heated pool provides.
