How to recover your system from being crashed by [Max Webstar](#)

Article published on February 17th 2012 | [Computer](#)

Operating system is always of great importance as it is the backbone of the computer system. An operating system is system software that is responsible of providing the interaction between the hardware of the computer and the user. It plays a third man role in providing the user with an interface to accomplish the tasks effectively and easily. Today, system software is much powerful and much flexible for managing the user's tasks. These are more reliable and secure than the operating systems that were available in the past. These are performing multiple important and essential tasks for the betterment of the system and for the users to manage their tasks with great efficiency and effectiveness. These are not only providing the virtual platform for the users to manage all their tasks with real time interaction but also performing the management of the system resources for the optimal use.

An operating system is the platform for installing application software for managing the specific tasks with highest accuracy. The operating systems available to the users are multipurpose software that not only provide the interaction but also provide the inbuilt utility programs for managing the tasks with efficiency and effectiveness. Although the operating systems available today are much improved for providing the best solutions in the terms of specific task completion, but also improved in providing the security of the data but also very resistant to the system crashes and failures. A system crash refers to the malfunctioning of the hardware that may cause inaccessibility of the computer system. At the same time, operating system failure may also cause the similar problem because it is the responsible entity for providing the access to the data and to access the computer resources and if it gets damaged all the resources of the computer system are inaccessible for the users.

Operating system failure can happen because of the multiple reasons that are always associated with the Windows operating system and computer system itself. The most frequently occurring problems are the operating system startup failure that happens because of the corrupted or damaged system files that are necessary for running the system smoothly. Another similar problems are blue or black screens that are because of the hardware malfunctioning.

The maintenance of the operating system is as necessary as the overall maintenance of the system is required. Most of the people do think that there is no other solution for the operating system failure except the re-installation of Windows from start, but this is a dangerous solution because all your data that is present on the drive where the operating system is going to be installed can be deleted or replaced and your data is lost. This solution can be avoided via using appropriate tools that are provided by the third party developers that can fix and repair the damaged files of the computer for your system's effective performance. Windows recovery disk provided is the most appropriate solution for fixing the problems regarding the operating system malfunctioning. Windows recovery CD makes you able to repair and recover your system from the crash.
