Free anti wrinkle cream by [Radsonsmith](#)

Article published on August 3rd 2012 | [Fitness](#)

Before you choose an anti wrinkle cream, you must know the science of skin and aging. This helps you make the right choice in creams. You will realize why it's important to have clinically-tested ingredients in the formula. That's the reason why any other cream won't work.

Understanding aging

As you age, the epidermal layer (outer layer of the skin) gets thinner. Cells become less sticky, which decreases the skin's efficiency to trap moisture. This makes your skin drier. After every 10 years, the epidermal cells decrease in number by 10 percent. As decades pass, the cells become slower in division, which reduces the skin's capacity to repair itself speedily.

Aging affects the dermis (mid layer) of the skin drastically. This layer becomes thinner. Collagen levels in it plummet. Elastin fibers, which give skin its elasticity, exhaust out. These changes cause the skin surface to sag and wrinkle. In addition to this, sebaceous glands become larger, yet secrete less sebum or oil. Sweat glands also decrease in number. Reduction in both oil and glands leads to dryness of the skin.

The dermal-epidermal joint comprises rete-ridges. They flatten because of aging. This makes your skin more delicate. The surface area of the epidermis in contact with the dermis decreases. This reduces the quantity of nutrients that reach the epidermis. It also disrupts the normal capability of the skin to repair itself. Only the best anti wrinkle cream can help to repair the damaged skin structure.

The deepest layer of the skin, called subcutaneous layer or hypodermis, contains fat cells that become smaller as you age. This is also one of the reasons for your skin to look thinner. A thin skin with lesser fat cells is bound to show sags and wrinkles more prominently. Now your skin contains insufficient fat cells to "fill in" the damage on the skin's other layers.

Your skin becomes more vulnerable to sun damage and harm from other elements. The overall mechanism of your skin that nourishes, protects, and defends it, begins to weaken.

Hydroxatone

This is the 21st century breakthrough in anti aging formula. It contains well-researched ingredients that are tested clinically. Each ingredient in this formula is potent, natural-based, and works along the lines of the skin's mechanism.

The formula contains:

• Matrixyl 3000 " it is a combination of peptides that repair the "matrix" of the skin. It works in the dermis and rejuvenates its mechanism of producing collagen.

• Argireline " it works on the epidermis and relaxes facial muscles that smoothens skin surface.

• Hyaluronic Acid " it penetrates in the deepest skin layer and helps to replenish moisture in the skin cells. This plumps up the surface and reduces wrinkle visibility.

• Sun Protection Factor " it protects epidermis and dermis from the harmful ultraviolet A and

ultraviolet B rays of the sun. This safeguards your skin from further sun damage.

â€œ Moisturizing agent â€œ it keeps your skin supple and hydrated. This contributes to reducing creases and folds on your skin.

Get Hydroxatone free trial online and watch the effects unfolding on your skin. Youâ€™d be amazed at the sheer effectiveness of this anti wrinkle cream in wrinkle reduction.
