Inkjet Refill Kits- a Greener Way to Save Money on Printing Cost by [Printer Cartridge](#)

Article published on May 14th 2012 | [Hardware](#)

Inkjet printing is one of the most popular printing technologies commonly for home as well as small business users. Inkjet printers are always the most preferred choice for most users because of the outstanding features- versatility, inexpensiveness and high-quality printing capacity. Over the past few years, the price of inkjet printers has fallen considerably but the cost of replacement ink cartridges is extremely high.

However, to reduce the over costs of printing, consumers are looking for cheap alternatives. Indeed, there are many options available, these include- compatible or generic cartridges, remanufactured or refurbished cartridges. But the most economical and environmentally friendly option available is the inkjet refill kits. A refill kit costs almost half of the price of a typical brand name replacement cartridge. That means consumers can save up to 80% on buying one refill kit instead of spending money on new cartridges. Moreover, refilling old empty cartridges is also good for the environment. It reduces the amount of cartridges being thrown away and also saves extra resources to produce new cartridges.

Refilling is easy and most people can do it themselves. All you need to do is follow the instructions provided with the kit and follow it accordingly. You will find that just within minutes your cartridge is good as new. However, some safety measures should be undertaken when refilling your own ink cartridges.

So, make it sure that the cartridge should be refilled before it has completely run out of ink. If printing is done after the ink is exhausted, it would end up burning the cartridge's nozzle and be permanently damaged. Remember that once the nozzle is damaged, it is not at possible to reuse the cartridge. Furthermore, refilling the cartridge with excessive ink can also cause problem; the ink will overflow or there will be uneven absorption of ink into the sponge. This would lead to ink leakage and poor quality print output. Therefore, refilling can also be a very messy job, make sure to cover the area where refilling will be done in order to avoid any untidiness and staining of the surface.

Generally speaking, using an inkjet refill kit is an eco-friendly and more affordable option than purchasing a brand new cartridge. Many people are skeptical about the quality of ink refills. But, it is likely that refills do not produce inferior output but rather match the quality obtained with an Original Equipment Manufacturer (OEM) product.
