Why Computers are Better for Trading than the Human Brain by [Thomasgalvin](#)

Article published on January 11th 2012 | [Hardware](#)

We've come a long way from using written charts to try and predict the patterns of the stock market. Today, we have computers to do the calculations for us. Technology has come as far as to allow us to trade from home, instead of having to go to the pit down on Wall Street. But without the right day trading computer systems, you won't be able to run all of the applications seamlessly. Day trading requires multiple windows and operations to be running at one time, so it is imperative for you to have the best trading computers for your setup.

The human brain and computers operate the same way, but computers don't have emotions that can cloud its judgment. The human brain also can't calculate as quickly as a computer or store as much information (and recollect it). Using day trading computer systems eliminates these problems and allows you to day trade with much fewer flaws. Of course, errors can still occur, which is why you should only purchase the best trading computers. This means that you will need a PC that can handle fast speeds and storing lots of data.

For speed, your trading computer will need to have a superior processor and memory RAM. For storage, you will need a hard drive with at least one terabyte of disk space. Then you will need a "windshield", which will be multiple monitors and high definition graphics cards. With this type of PC being used for your day trading, you won't have to worry about common human errors that usually occur, like being tired, stressed or worried, which are all known to make your decision making less than reliable.

Of course, just because your superior computer and applications are smart and fast, it doesn't mean that they can always make accurate predictions. You will need to use your better judgment to determine whether to buy in or pull the plug on certain stocks. Sometimes a guy feeling or a heads up from current events happening around the world can trigger your brain's analytical powers. So don't solely rely on your computer for your day trading. But the one thing that you should be able to rely on from your computer is that it has enough power and speed to act as a vehicle for your day trading.

If you're new to the day trading field, make sure that you don't expect your software to teach or guide you solely down your path to financial success. All of the top traders have years of experience, so don't be afraid to take risks and learn the same way the pros do. If you are ready to learn more about the best trading computers on the market,
