A Cosmetic Dentistry Professional in NYC educates us on Dentures - Part II by [Dentalcarenyc](http://www.articleside.com/health-articles/a-cosmetic-dentistry-professional-in-nyc-educates-us-on-dentures-part-ii.htm)

Article published on May 16th 2012 | [Health](#)

This article is in continuation to the article that was written earlier under the same Title and Introduction.

I often used to wonder as a child that how grandma took her teeth off and placed them back in the morning, I wished I could do the same with my teeth. These prosthetic teeth are known as dentures and are used all around the world by the elderly. These false set of teeth or dentures help to maintain the structure of an individual face along with allowing him/her to perform the other functional activities. Those hoping to get dentures customized for their teeth can easily walk in to one of the cosmetic dentistry clinics of New York City. A Cosmetic Dentistry NYC expert can easily perform this restorative dental procedure that involves fitting an individual with customized dentures.

A Cosmetic Dentistry NYC expertise is helpful for those looking to get dentures fitted for their missing teeth. In the section below, one such professional helps to provide the complete knowledge about dentures and also tackles the various myths surrounding these prosthetic set of teeth -

Modern day dentures – Most modern day dentures are usually constructed in a dental laboratory where these false teeth are made of acrylic material and are easily coordinated according to various shades and color in order to match the natural teeth.

Cares for dentures – Most cosmetic dentistry NYC professionals recommend mechanical or chemical dental cleaners. This is because it is easy for plaque to develop on the teeth just like it does on natural teeth.

Constructions of dentures – The construction of dentures involve the use of acrylic and tissue shaded powder polymethylmethacrylate acrylic (PMMA). The Cosmetic Dentistry NYC clinic takes the impression of the either the upper or the lower jaw where the teeth are missing. Using a wax rim as the model the denture is constructed. This is followed by the trial of these dentures in which they are fitted in to the candidate’s mouth in order to see if they are properly fitted or not. In case the bite alignment is not proper, these dentures are corrected before fitting.

Firmness of dentures – The steadiness of these prosthetic teeth depends upon three different principles that include support, stability and retention. The principle of the support implies hat how well the oral tissue is tolerates the dentures and prevents it from moving deeper in to the arch. The principle of the stability controls that the dentures do not move in a horizontal plane either forward or backward. The last principle of retention governs how the denture is prevented from moving in the opposite direction of insertion.
