High-quality hospitals are the most important to all type of patient's sickness. A good quality of hospitals are providing a good facilities to patients to solve problems of illness of any types of problem related to disease .Hospitals in India are highly multifaceted organizations by virtue of the many functions they seek to fulfill, the multiplicity of activities and tasks, variety of staff with a plethora of skill mix, wide repertoire of technologies in use, image of human suffering and continuous pressure to perform on matters pertaining to life and death.

It can be understood by another example, in the operating room at the Hospital Delhi, the sponges used during surgery all have RFID chips in them to ensure right counts at the end of surgeries. The sponges with RFID tags, if left in the patient, are detected past to finishing surgery and removed.

Using the RFID chips in hospital in India allows the surgical team to provide high quality, safe care to patients, as there are not any retained foreign objects, which can lead to complications and additional costs. One of the most significant issues in current is facing by hospital staff for increasing financial pressure. Head of Policy Nigel Edwards of the NHS Confederation is reported as warning urgent action needs to be taken to find innovative ways of making the service more efficient before the financial pressure increases.

Delhi has one of the fastest growing series of hospitals in India, engaged in providing the primary as well as tertiary healthcare services, with a disparity. Hospitals in Delhi are the sequence that is founded and managed by professionals with a project and fervor for providing healthcare for the needy.

At care, the increase has been unique. Hospitals in Delhi are based on the principle that some diseases might not have a cure at present, but a treatment might be offered sooner than later; and therefore, the best potential thing to do would be to keep the condition of patients from degeneration.

Access to consumer information, health service market has changed. whereas cost management and price competition are still the main sources of competitive advantage for hospitals, as consumers have more access to the quality of care at hospitals, administrators have been alerted to the fact that they must also create value-adding services that improve the quality of patient care if they want to remain competitive. Hospitals have realized that RFID provides the tools to do this as the technology streamlines processes, frees up human capital, and improves accuracy and so the quality of patient care.
