Eye surgery in India – vision correction surgery [By Atul Sharma](#)

Article published on May 16th 2012 | [Health](#)

We believe that eyes are the window to every individual soul, so why not maintain their appearance and make them look beautiful, eye surgery in India is one destination for patients from world-wide. Modern eye surgery techniques have improved the vision and appearance to several people. Eye surgery is the latest and the most innovative surgical technique that helps hundreds and millions of people to improve vision and have a better attitude towards life with their beautiful eyes. This surgery is believed to be a blessing.

Eye Surgery India is a safe clinical method with very low complication rate. Most of the people return to work about three days after eye surgery. In reality every cases is guided by the doctor's advice. Many people even resume to work and other normal activities a day after surgery. The outcome, precautions and results completely depends on the personal value systems. Life after eye surgery becomes very different and considerably better. This is a type of medical surgery that corrects the vision and is the most commonly performed surgery.

There are different levels of surgeries and depending on different levels, the surgery takes about 20 to 50 seconds. Most of the patients are relaxed and comfortable because during the Eye Surgery India because of the local aesthetic eye drops that are given before to the surgery. Recovery phase is about 30 minutes and a person gets back to normal activities within three to four days of the surgery.

With any kind of eye surgery, it is important to follow the doctor's advice and instructions. The success of any surgery greatly depends on the patient's efforts and level of rest. The patient is advised to take necessary prescriptions and give rest to his or her eyes for few days after the eye surgery in India. The patient also needs to take care of the eyes and keep them away from any kind of dust particles or other foreign particles. Any leniency in the care and precaution can lead to undesirable conditions like lost vision, dry eye condition or even hazy vision.

Many times patients complain of some problem at night or around lights after the surgery and are advised to avoid rubbing their eyes. Rubbing the eyes can displace the corneal flap and cause severe damage. The patient also needs to avoid shower or getting soap into the eyes for next few days after surgery. This can also disturb the normal condition of eye. Avoid swimming and any kind of eye contact with tap water. Eye protection is recommended for at least few weeks if the patient is involved in any kind of sports or exercise. Some people have improvement instantly and some may even notice it within a week's time.
