Information About Dental Implants by [Roya Zojaji](#)

Article published on January 31st 2012 | [Health](#)

Dental implants can be very frightening for most people. The reason is that this type of medical procedure usually includes separate in order to obtain a certain level of sedation. In most cases, people are forced to go into a light sleep, which allows the surgeon to operate more easily in the mouth without causing much distress and discomfort to the patient.

Why no one really even need dental implants? That is a question that you really need to stop and think. Most often, this particular type of operation is the result of your natural teeth to be removed from your mouth. While there is nothing that says you have to have dental implants installed, most people feel they need something to replace teeth that have been deleted. Not only will this help in connection with self-esteem problems, but it also can help a person chew food more thoroughly.

Individuals may lose their teeth for a variety of reasons. Teeth may fall out because of injury, accident or old age. Teeth can also be extracted because of gum disease, tooth decay, not the root canal and so on. Regardless of the cause of tooth loss, it is only when they're gone; you begin to realize how important they were for your appearance and lifestyle. About twenty years ago, patients would only have the options of fixed bridges or removable dentures, to regain the functionality of their missing teeth. Today, however, advances in dentistry have given patients a valuable option in dental restoration dental implant care.

Commonly called dental implants, dental implants do not rely on the jaw line, as dentures, and they do not require neighboring teeth for support as permanent bridges. Teeth implants usually consist of small insertions, which are surgically installed in the jawbone, which supports and prosthetics later annexed. There are different types of dental implant systems available today to the various requirements of the patient.

Implants to support prosthetic teeth are made of various materials, which include pure titanium, zirconium, titanium and surgical stainless steel alloy. These materials are biologically inert in nature, that is, they are generally accepted body's immune system, in most cases without the risk of allergic reactions. Pure titanium, as a rule is the most preferred dental implants because of its high strength, corrosion resistance and bio compatibility. According to various studies, they do not react with the immune system of the human body in 98 percent of cases.
