Menopausal Issues and How to Relieve them with Bioidentical Hormone Therapy by [Jennifer West](#)

Article published on April 18th 2012 | [Health](#)

From childhood to seniority, people undergo a number of phases of development. However, there are several exemptions because of illness, accidents, or other similar grounds. Various physical and psychological changes happen in the course of these phases, which can affect the biological and emotional growth of human beings.

Women go through menopause which men do not encounter. However, some analysts will negate this, claiming that men do go through a related menopausal period, albeit in a different manner, which is called andropause. Menopause takes place when a woman is no longer capable to become pregnant as a result of remarkable shifts in her reproductive hormones. In other words, there is a complete absence of the menstrual period-- initially for one year--after which it becomes long-lasting.

Menopause does not take place suddenly but goes through a period of change which begins with perimenopause or "the period around menopause". This is a non-medical term used to describe certain facets of the period in layman's terms such as hot flashes and night sweats. Postmenopause is the period of time that follows the last menstrual cycle, while menopause occurs when a woman's ovaries ultimately stops functioning. During these stages, women go through various biological adjustments in their bodies which may cause some stress.

The ovaries are where female hormones such as progesterones and estrogens are generated. They regulate the development of a woman's bodily attributes, like the breasts, body shape, and body hair. These hormones control menstruation, including pregnancy.

Although the average age of menopause in the United States is 51, some women encounter it at an earlier time or even later, and it is considered ordinary for women to undergo it at any time between the ages of 35 and 59. A few say that women normally tend to undergo menopause at an age comparable to that of their mothers', but this has not yet been endorsed by any medical investigation. At present, nonetheless, the effects of menopause are controllable through bioidentical hormone therapy.

Not all women have the same menopausal signs-- some go through a lot, others some, while a few none at all. Nevertheless, all females should promptly seek their physician's professional assistance to make the menopausal change a simpler and less difficult encounter. The right bioidentical hormones menopause treatment may help alleviate any inconveniences caused by the concern.

Each woman has her own unique biological rhythm which will figure out the moment she will go through menopause. A woman should remember that it is a natural and inevitable womanly condition which bioidentical hormones for menopause may help handle.
