More on Propecia â€” a Hair Loss Treatment [Kelly Kites](#)

Article published on June 12th 2012 | [Health](#)

Male pattern baldness is one of the most commonly experience hair loss condition amongst men. It is especially difficult for a man who is in his 20s who starts to lose his hair. This is because many people mistakenly believe that hair loss only occurs in older men. This can definitely prove embarrassing and distressing, not only in the personal front but socially too. Click here to learn more about this condition.

Men who are young and balding can feel self-conscious in their social circle, which can lead to their withdrawal from social settings. Such incidences can also affect their self-image, self-esteem and confidence. To avoid such embarrassment, you can go take help of the 1mg Propecia pill available as a prescription treatment for this condition. In simple terms, you start losing your hair if the amount of DHT, dihydrotestosterone, an androgen hormone produced from testosterone, increases. When the levels of DHT increase, they affect your hair follicles in a manner that they start shrinking, thinning your hair line.

Eventually, under the effect of DHT, the hair follicles close up, leading to the hair falling out. This leaves a bald patch on the affected area. Propecia, with the help of its active ingredient finasteride, affects the production of DHT, thus reducing its effect on the hair follicles. It proceeds to repair the damaged hair follicles, healing them and making them once again capable enough to participate in hair re-growth. You should, though, note that this is a long term treatment and stopping the hair loss medication will reverse its effects.

It is also worth noting that despite Propecia being an effective hair loss medication, it also contains a risk of side effects. This is because it is a prescription medication, and all prescription medications contain a small risk of side effects. You may have heard that Propecia can cause side effects that are sexual in nature, such as the development of erectile dysfunction, or impotence. It is important to note that no definitive medical proof has been found to show a link between taking Propecia and developing impotence. Numerous clinical trials have been undertaken on the medication and it has been determined that it is a very safe medication when used correctly.

If you are concerned about potential side effects, the best thing you can do is to consult your doctor before starting to take this hair loss medication. Some men though may find it embarrassing to visit a doctor personally for the treatment. To avoid such embarrassment, you can visit a licensed online clinic, where Propecia can be purchased online. You will only be required to go through an online consultation with a licensed doctor before placing the order.
