Scar Tissue Removal is the first thing on your mind after you have surgery, or receive an injury that breaks the skin. Scars come in all shapes and sizes. Keloid Scar Tissue is scar tissue that is larger than the wound itself. Scarring is also something that takes place inside the body, where it can be quite a problem.

Scars are really just a gathering of Fibrin, or Fibrinogen. This is also the substance that causes plaque, and will slow down your blood circulation. It circulates throughout the body, and attaches to inflamed and injured areas. Tendons, ligaments and joints can all be affected by Fibrin deposits.

Scar Tissue Removal can be done in several ways. Dermabrasion is a common method, where the scar tissue is actually "sanded" off of the surface of the skin, this is not a pleasant procedure. Some people go for Laser treatments, while others have more surgery, to get rid of the scars from the last surgery, does that make sense? This is a gamble, because you could end up with worse scars than you started with. You can also opt for steroid injections into the scar.

There are topical formulas that can be used for scar tissue removal. Most of them are based on Vitamin E Tocopherols. This method has been around for many years, and has limited success, especially on thicker scars. All of the above methods do not even address the internal scarring that is so damaging to our health.

After you injure your shoulder, or your knee, for example, fibrin deposits begin the formation of internal scarring. This restricts the movement of the components of the joint. It is this type of scar tissue removal that is critical to health, not just looks. So, the question should be: How can we get rid of both internal and external scarring, without pain, and downtime.

The answer is obvious to most natural health practitioners. Proteolytic Enzymes digest protein. Scar tissue, or Fibrin, is made from protein. By taking an enzyme supplement with the right types of systemic enzymes, in the right amounts, you can say goodbye to scar tissue. Systemic Enzymes are those that work throughout the body, not just for digestion.

Enzyme Therapy is used by sports teams, and bodybuilders. They know how to heal the internal scarring caused by the injuries they frequently sustain. With all of the enzyme supplements available, it is hard to know which brand of systemic enzymes is the best.

Recently, a formula has been tested and approved, that has attracted the attention of the medical community. It is a one-of-a-kind formula, that is only made by one company in the world! Besides the ingredients, what sets this formula apart from all the rest, is the fact that it is a liquid filled softgel, with an enteric coating, so that it can pass through the strong acids in the stomach, and make its way to the small intestine for complete absorption.
