Taking a Better Look at the Two Classifications of Plastic Surgery: Cosmetic and Reconstructive by [Comerford](#)

Article published on March 12th 2012 | [Health](#)

Plastic surgery is a medical field that has been practiced for more than 2700 years. The restoration of the human body's aesthetics and function is the main focus of this specialty. The most ancient recorded operations were done in India by 800 BC which, a few hundred years later, played a role in the advance of the plastic and cataract surgery. Today, plastic surgery has advanced into one of the biggest medical practices treating different body problems, avoiding possible illnesses, and improving physical appearance.

The two sectors of plastic surgery are reconstructive and cosmetic. Reconstructive surgery is distinguished from cosmetic plastic surgery by its emphasis on the correction of functional problems, improving appearance and hindering probable difficulties from developing. Cosmetic plastic surgery, however, is more physical enhancement. It is also used to preserve a physical appearance or to repair it when altered by climatic factors.

Reconstructive plastic surgery typically handles genetic abnormalities and burns, along traumatic injuries like facial bone breaks. The most prevalent procedures categorized as reconstructive include scar repair, breast reduction, and tumor removal. Plastic surgeons in big states such as Arizona carry out several techniques in transferring tissue from one part of the body to another. In some situations, tissues from another source are used, a technique known as allografting. Tissues taken from a different species, though, are called xenografts.

Cosmetic plastic surgery is applied in a larger scale in various parts of the world. In the United States alone, around one million operations are added to the total number of procedures performed yearly. The five most frequent cosmetic surgeries are liposuction, breast augmentation, nasal surgery, eyelid surgery, and abdominoplasty. These procedures are performed in lots of countries, like the United Kingdom, France, and Germany. Cosmetic plastic surgery Arizona surgeons perform comprises more than half of the total plastic surgeries performed in clinics and offices.

Liposuction and breast augmentation are the most prominent cosmetic plastic surgeries. They utilize reverse processes in that breast augmentation warrants any safe technique to enhance the size, form, and feel of the bust, while liposuction lessens the form and size of a particular area of the body by eliminating the fat. An Arizona plastic surgeon also includes liposuction in other operations like abdominoplasty.

Going through any procedure requires a patient to undergo three steps: pre-operative, actual operation, and post-operative. In plastic surgeon Arizona features doctors who dutifully informs patients with the advantages and dangers of the operation and offers instruction to hasten healing during the post-operative step.
