The Top Sterilization Products Dental Offices Must Have by [Philipps](#)

Article published on April 20th 2012 | [Health](#)

Sterilization is imperative in any healthcare facility. If you own a dental office, you should take steps to ensure a safe, hygienic, and secure work and treatment environment for your employees and patients. A clean dental office also attracts more clients as this is a prerequisite for customer satisfaction. These sterilization products are some of the essentials any dental office should have. Make sure to stock them in your office to prepare for any emergency situation.

Pouches

Recommended for environment-conscious oral and dental healthcare professionals, reusable sterilization pouches can be used up to 200 times, saving storage space, reducing excess waste, and cutting sterilization costs. Alternatively, multi-parameter self-healing pouches can be used in steam and chemical vapor with these products' internal and external indicators for effective sterilization. Dry heat self-healing pouches also feature built-in adhesive tapes and clear, strong, and puncture-resistant nylon material.

Wrap

Highly-permeable sterilization wraps have the highest bacterial filtration efficiency and liquid repellency quality and exceptional strength. Made of strong and reliable non-woven fabric, these products keep your sterilized instruments clean and ready for use. Reusable two-ply sterilization wraps, on the other hand, deliver the protection of double wrapping in a single step. These materials keep your tools ready for use, saving you time when dealing with patients.

Tubing

Essential dental office sterilization products also include nylon tubing. Fabricated from clear and puncture-resistant nylon, these materials can be used in steam, chemical vapor, and dry heat sterilizers. You can seal these with process indicator tape or heat sealer for more effective sterilization. These products are commonly sold per roll. Dental practitioners also purchase gauze sponges when shopping for nylon tubing.

Biological Monitoring

Most oral and dental healthcare professionals also purchase biological monitoring sterilization products for their office. You can use one of these per load to determine whether all critical parameters of steam sterilization have been met, removing the possible release of non-sterile items in your office. Manufactured with advanced technology, these provide a simple and accurate method of ensuring proper sterilization of your tools. These instruments help you maintain a high level of service quality in your dental practice.

Indicator Strips and Tape

Various indicator strips and tapes in the market are necessary for sealing bags, tubing, and wraps in your office. These indicate that sterilization conditions, such as time, temperature, and steam presence, have been achieved. These sterilization products also ensure that heat has penetrated the packaging material and is reaching your dental instruments inside.
