Treating Varicose veins: Varicose and spider vein treatment by [Orcutt Wilson](#)

Article published on March 20th 2012 | [Health](#)

How to treat varicose veins and spider veins? Varicose veins and spider veins can be treated in several ways, including a change in lifestyle and medical treatment. Both of these means of varicose and spider vein treatment can alleviate the symptoms, improve the appearance of the patient and prevent further medical complications. Both of these means of treatment for veins are utilized and your doctor will decide which varicose and spider vein treatment, depending on the severity of your condition.

Some of the treatment for veins and treatment for varicose veins include:

1. **compression stockings:** this varicose and spider vein treatment is typically the first mode of processing and are used to put pressure on the veins, thus, hopefully, relieving the symptoms caused by spider veins and varicose veins. The three primary types of compression stockings for the treatment of veins and treatment of varicose veins is a) support pantyhose; b) over the counter gradient compression hose; and c) prescription gradient compression hose used for varicose vein treatment and had to be properly fitted to your doctor's Office.
2. **Sclerotherapy (SKLER-o-ther-a-pee):** Sclerotherapy is a common varicose and spider vein treatment where the doctor will use a needle to inject a liquid chemical in vein. Chemical causes the vein walls to swell, stick together and turn off the seal. This stops the flow of blood and the vein turns into scar tissue. In a few weeks, the vein will wither. This treatment requires no anesthesia and can be performed in the doctor's office. Most people receive this treatment for veins can return to work immediately after varicose and spider vein treatment. This treatment for veins can require the same vein may need to be treated in more than once every 4-6 weeks. Moreover, exploitation of this treatment for veins, most doctors will require that the patient receives the varicose vein treatment wear prescription gradient compression hose. Some of the side effects of this mode of treatment of spider veins and varicose veins include stinging, red, raised patches of skin and possible bruising where treatment for veins were made. These symptoms after vein surgery in Montana usually go away and the decline in hours or days after treatment.
3. **Radio frequency and laser endovenous varicose vein removal techniques by:** this treatment for veins, especially the deeper veins of the leg, called the saphenous (SAF-uh-nuhs) veins, is often done in the physician's office varicose vein removal. When the doctor uses this treatment for varicose and spider veins, he/she will place a small tube, or catheter, into the vein. Afterwards, a small probe is placed through the catheter and a device on the tip of the probe heats up inside the vein and close it off. Under this treatment for veins, the doctor will either use radiofrequency or laser energy to seal the vein. After the vein is closed off, healthy veins around the closed vein will take over the normal flow of blood and the symptoms of varicose vein will dramatically improve. In addition, when this treatment is used for the surface veins, the veins that connected to the varicose vein usually shrink after varicose and spider vein treatment. But if they don't subside considerably, it is common to use this treatment when sclerotherapy of veins.
4. **Ambulatory Phlebectomy:** large varicose vein and spider vein treatment may include ambulatory phlebectomy, along with the above treatments. This treatment for veins and treatment for varicose veins is performed in the physician's office and local anesthesia is used. In this type of varicose vein removal, tiny incisions are made in the skin and small surgical hooks are used to remove the vein from the leg. This treatment for veins are generally used for removal of large varicose veins. As indicated above, there are several different ways of treatment for spider veins, and more specifically the veins and varicose veins. Many of these treatments for veins are performed in the physician's

office, and the varicose and spider vein treatment can lead to the eradication of the problem in a short period of time without invasive procedures.
