How to Keep Your Plumbing System Efficient During Winter Season by [Tanya Carter](#)

Article published on December 26th 2011 | [Home Improvement](#)

If you live in the environment where temperature drops to the freezing point, then you must take care of your plumbing system, because it is one that gives up first. You must know the indoor and outdoor pipes that can freeze the flow of water. Frozen pipes can restrict the normal flow due to very low temperature. If you are using a garden hose, you will have to remove it as soon as possible because it can go out of order. You have to make several preparations before the freezing temperature sets in. You should make sure all outdoor pipes are drained to prevent potential damage.

If possible you should call your plumber; he is the one that can give you tips and guidance on maintaining your complete plumbing system during freezing temperature. They can offer you an insulated jacket to place it on the exterior when you take out the hose. They provide advanced faucet installation services that work well throughout the winter season. However, this is also vital to shield the connection inside your home. Some homes are already equipped with shut-off valves. You should use it to drain the water in the pipes found in the outdoors.

Plumbers also make recommendations to keep the temperature maintained at 55 degree inside so that pipes will not freeze. You also need to open the cabinet doors under the sinks so that warm air can circulate to prevent the pipes to freeze and shrink. Garage doors and space vents should also be shut down because the cold temperature can come in. The water drainage should also be checked carefully before the lowering of temperature. You have to ensure that the discharge line is working properly. Plumbers also guide you to protect your drain from clogging by restricting the heavy use of drainage. They guide you to use high-quality and effective drain cleaner every week and mix it with baking soda, and salt.

Most of the time plumbing service providers recommend insulating your home for proper heating. It not only keeps faucets, drains and pipes running efficiently but also keeps the internal temperature warm throughout. Proper insulation forms an envelope that encapsulates your home and restricts cold air to come in. In fact, it is the world-acclaimed technique that can help protect the houses and make it more energy efficient. It also reduces the overall consumption of energy resources which substantially lowers the rising energy bills. Plumbers recommend the absolute home insulation and attic insulation for perfect sealing of homes. It also keeps the plumbing system healthy and warm during freezing temperature.
