Siding Maintenance Ideas for Better House Aesthetics by [Gabrielle Jeromy](#)

Article published on June 6th 2012 | [Home Improvement](#)

Siding is cladding installed on a residential or commercial building to buttress the walls. Homes with siding are less susceptible to permeation during heavy rains and are more energy-efficient. Siding also improves the home exterior's aesthetics and eventually increases its resale value.

Commercially available siding comes in different materials, colors, and layout designs, and can be manufactured into sheets, shingles, and vertical or horizontal boards. While siding prevents water or moisture from seeping through the walls, some siding materials face similar challenges, especially when poorly installed. In the long run, siding will deteriorate and cause some trouble to a structure, and thus regular maintenance and care must be performed throughout its lifetime.

Vinyl is one of the fastest growing siding materials available for any type of building, especially for homes in prominent states like New Jersey. When caring for vinyl siding, a homeowner can practice rinsing the siding with water whenever he uses the garden hose. At a minimal pressure, the water can remove dust and grime that can potentially speed up the siding's deterioration.

Rinsing with water definitely requires a lot of work since siding covers almost entirely the home exterior. In fact, experts in home care recommend brushing away thick grime and stain with a soft brush or wiping with cloth pad. The stain from grime may burn the surface of the vinyl siding or leave ugly spots.

Most homes have landscapes along sides or below the siding; plants in the landscape can be susceptible to withering when poured with inorganic or non-biodegradable cleaning agents. The homeowner must make sure he uses biodegradable agents to prevent poisoning plants when cleaning siding. Even during the installation, siding contractors NJ recommends must be careful with cleaning agents to protect the landscape. If not toxic, these chemicals can leave stains on the leaves or branches of the plants, which might ruin their appeal.

Like other structural accessories installed using adhesive tape, siding can go out of shape when exposed to sunlight. Either the homeowner can install it at a corner where a tree provides shade or he can plant trees around the house to provide shade to the siding. The vinyl siding NJ siding contractors install is known for its ability to withstand extreme heat from sunlight.

More information about vinyl siding is found in ehow.com. This website provides comprehensive steps in improving vinyl siding efficiency and prolong its life. It also has pieces of information on home remodeling which a NJ home improvement contractor specializes in.
