Stone, Ceramic, and Glass Tiles and Their Strengths and Weaknesses by [Alana Geikie](#)

Article published on April 14th 2012 | [Home Improvement](#)

Installing tiles in the bathroom and kitchen is often complex due to the fact that these places are damp and prone to moss accumulation. To help facilitate cleaning, bathrooms have tiled surfaces, providing smooth surfaces and minimizing spots where moss could develop. However, choosing the appropriate type of tile continues to be a significant matter.

As a lot of people may tell you, some of these tiles are more suitable for various areas in the house than in others. Smooth glass tiles are considered more appropriate for kitchen or bathroom counters as opposed to flooring, while various stone tiles are fine works as either countertop or flooring tiles. Your choice greatly is determined by aesthetics and functionality, so it really is sensible to take into account what these materials are made of and how the environment impacts them.

Stone tiles have been utilized for kitchen and bathroom floors for a long time. Even with the development of ceramic and glass tiles, stone tiles remain well-known choices. This is because many kinds of stone tiles make excellent materials for house places that experience a lot of dampness.

Limestone is one of the most widely utilized materials in modern day architecture. Various kinds of limestone have been used to produce edifices, pavements and roads, and sculptures. Nowadays, this calcium carbonate mineral can also be used as interior flooring material; the flexibility of limestone aggregates enable manufacturers to make floor tiles from almost any color and texture of limestone.

Among the numerous types of limestone, travertine has the unique feature of being one of the most durable. Occurring in nature as stalagmites, stalactites, and in places where mineral springs formed, travertine differs in terms of hardness and consistency. It really is broadly used as a construction material. It's suitable in a travertine chair rail in kitchens where it's less likely to grow mold.

Fungi like moss, mold, or mushrooms are a particular dilemma for homeowners, which is why they prefer to install Provenza tiles as an alternative to wood panels for kitchens or patios. A Provenza tile is a type of ceramic tile that is designed to copy the color and texture of wood. This inorganic material can last twice as long as wood, but is more breakable; carefulness really should be observed during installation to avoid damaging the tiles.

The ability of unglazed ceramic and stone tiles to accumulate and grow moss isn't a problem if you select Vetro glass tiles for the bathroom. Produced from recycled glass, these tiles can are available in a broad selection of colors and imitate ceramic. You may go to [FloorGuide.com](#) for more info.
