The Meaning of concrete polishing and concrete saw by [Edwardross](#)

Article published on April 27th 2012 | [Home Improvement](#)

Many people prefer to get professional help when it comes to marble polishing. But it can end up costing you quite a lot and you do not need to spend that kind of money when you can just as easily do it yourself. However, it does take quite a bit of care and education.

There's nothing like a beautifully polished marble floor. Regardless of what polishing process you use on your marble, the first step it always to ensure that it is clean and free of debris, grime, or dirt. This can be done with a mop and water, or mild cleaning solution. After this, you'll need to make sure that the marble dries completely before starting any polishing process.

Unlike concrete polishing where you need a concrete saw and other equipment, marble polishing is simple and fairly easy to do. All you need are the right products and kits to help you. Regardless of what process you decide to use, be sure to read all instructions and manufacturers recommendations when using different machines and products. Your marble floors are a great asset, and need to be handled with great care.

If you do decide to do it yourself, you'll need a small hand buffer, and buffing pads that fit the buffer. Apply a marble stripper to the surface and cleaning the grout between tiles, if you have them. Once the stripping is finished, rinse the marble at least twice with clean water and a clean mop. Make sure to get all remnants of stripper off your machinery before beginning to polish. If you don't, it could ruin the polishing process which means that you'll have to start from the top again.

Next, you'll need to put a clean pad on the buffer and apply the polish to the marble in 3'x 3' areas. You'll do this by putting a couple of sprays of marble polish on the surface of the marble at a time, and using a side-to-side motion to buff the floor until it is dry. Do this in sections. Once through the total area, go section by section again applying another coat. Repeat this until the floor or counter-top is as shiny as you want it to be.
