Why Investment on Preventive Fire Protection Systems for Homes Make Sense by [Nathan Brown T](#)

Article published on December 29th 2011 | [Home Security](#)

The first thing that strikes anyone's mind when talking about home safety is burglary, thieves, robberies—but remember that the biggest hazard that can work against your home's safety is fire. Name anything that has uses in your home; appliances, insulations, kitchen, clothing or even the furniture, they are all potential candidates to ignite a fire that is very difficult to control. Fire is such that, even when you notice them in their benign start, the natural instinct is to run away and appeal for help. And by the time help has arrived, the entire home would have been razed to ground, especially if it is an old residential building.

Most times, residential fires can be attributed to carelessness and improper use of material in constructing your home. There is little that you can do to an old house, other than razing it down and rebuilding. But the expenses can deter you if you don't plan to spend any more money than you have spent on maintaining them. However, you can think of taking those little steps to prevent fire in the first place, and then think about an exigency plan in the event of an unfortunate situation.

Here are those little steps you sure may want for your home. They are not really as expensive as it would be like losing your cherished belongings. On the sidelines think about taking an insurance cover for your home, they are oftener better than losing your lifetime savings. Besides the reimbursement you will receive, the very thought that you have insured your home can be reassuring and give you a sense of security.

Your home may be a condominium or a palatial building, whichever way, plan to install an ADT Alarm System for each of the places where it is possible to perceive an accidental fire. The most likely candidate to get the first alarm, as you may have imagined, is the kitchen, and then progressively to other places, like the cellar, bedroom, living room and even garage, and not to forget the barn, if you live in the countryside. Not all will have the resources to get them in a single go, and if you too don't, then install one system at a time. But, before you buy the gadget, make sure they are of the same make and can be interconnected. That is because you will anyway need to do it later.

Interconnecting all the fire alarms has advantages. By doing so, you are also creating a workable system for your home rather than a standalone fire alarm. The first advantage of an integrated alarm system is you get alerted even when you are not in a particular room where you have an alarm and that is because even if a single alarm sounds you get alerted where ever you may be in the house.

Fire alarms will help you notify fire, but is not an insurance against collateral damages, which is usually the case with a huge fire. So, having some firefighting equipment handy all the time and in spic and span condition will actually protect you and your family from loss, or at least minimize the damages, and will give you the confidence to fight against them should you have to react. One of the commonest firefighting equipment is the extinguisher.

Equipments are not fit and forget things. They need to be maintained periodically, especially the fire extinguishers; they have definite life cycle. Replace them when it is time to do so. Have all your alarms connected to a battery system that will back up with power in the event of an outage. Follow safety tips on home appliances, and finally have electrical wiring systems checked for compliance as per the civic norms prescribed in your area.
