Check if your privacy is maintained..!! if not, secure it..!! by [RitaDawson](#)

Have you checked your online privacy? Are you also concerned about your online privacy? You know what; you are one amongst the million in the world concerning their online privacy.

Privacy issue is next in the list that people would prefer after the speed matter. When it comes to internet connection, speed matters first and then the privacy. Every individual is more and more concerned about his online privacy and also wishes to have a secure connection. In such case, you can ensure your online privacy by following simple steps while surfing through the internet.

Do you know maintain privacy online is very simple if we get to know what to do and what not to do? The first factor that you need to consider about your online privacy is to know whether you have a â€œSecure Internet Connectionâ€•. There are many service providers offering you high speed internet connection, but choosing a secure and reliable high speed internet connection like the Time Warner Internet is the most important fact that helps a lot in maintaining online privacy.

The next factor that you need to take care is that â€œNever reveal your personal informationâ€•. Avoid shedding your personal information like email address, contact information without configuring your Web browser. Do not provide with any identifiable details in the Setup or Options menu in the browser unless you wish to share it. Prefer revealing details on site-2-site basis like share information on the sites you think to be safe and avoid the websites that you have never come across.

â€œCookiesâ€• can help you for an easy and secure browsing. Ensure that you have turned on the cookie that are issued by the website that stores your information temporarily or permanently. Cookies are useful that you need not type the password or user ID again and again when you visit that particular website that can be read only by the person who created them.

Make sure that you use a â€œSecure Browserâ€•. If you feel your browser isnâ€™t that secure, try chang with other alternatives. Also ensure that your browser doesnâ€™t remember your user ID and passwords when you are logging into your mail, especially if itâ€™s a public computer or if the computer is on a network. Have a clean email address and avoid group mailing or chat lists with your personal email when you are on a network or in the office. Avoid revealing your information to strangers in the network or just met friends in office. Remember, when you are at work, you are being monitored, and so avoid even having sensitive files on your computer and also prevent personal mailing.

List out the different â€œSites offering rewards or prizesâ€• just when you click on them and make sure th you donâ€™t get into them, as they do award you in exchange of your personal details. Your personal details are much more to these sites as they can sell it to anybody for a value more than the reward you got. Never reply to a spammer. Whatever may be the reason, avoid replying them irrespective of however good the offer is that they make. If you get to open the message, sometimes you get to forward it to everybody on your mailing list or sometimes your personal details are revealed to the spammer as a reply.

You got to be very conscious about the â€œWeb Securityâ€• while browsing. In case you are banking or shopping online where you get to provide your credit card number, make sure you have the https:// before the web address and not the http:// in the URL. The https:// denotes that your transactions are secure and only you and the bank officials can access your credit card number. Now as a final step check your online privacy through the websites that check your online privacy level accurately and examine the privacy policies of your service provider. Not to mention, even if you have a secure

internet connection, your online privacy can be at risk, if you donâ€™t decide what information is to be revealed, to whom and when and how and what not to be revealed.
