How to Apply Google Data Feeds to Market Your Products by [Jamie Viggiano](#)

Article published on June 4th 2012 | [Internet](#)

How do you make your products noticeable amid a number of websites without the requirement to develop multiple accounts synchronously? Google Product Search is the solution. However, to make your campaign effective, you would require the technical expertise as well as some advertising skill-sets.

Products presented on Google Product Search are submitted to the Google Merchant Center through the "Data Feed" feature. A data feed is an information that has codes for product listings, images and info. Google Merchant Center sustains the .txt, .xml, .gz, .zip and also .bz2 formats. However, the site mainly supports .txt as well as .xml.

The quickest record format is .txt, which is suggested for lesser tech-savvy modest small business owner. You can produce your list in spreadsheet programs as well as copy-paste them to a .txt file. However, the formatting of the last goods may be different from what you generated in the third-party program.

On the other hand, an XML file offers you more control over the format. Like .txt, you can generate this document with text editors. XML makes use of header tags, and also may need much more than fundamental technological know-how. If you believe this is the finest document format for you nonetheless, hire a person to deal with the technical points; for instance, 100+ lines of coding for a solitary programming language may look confusing, however your computer-savvy pal may shrug as well as point out: "Believe me, 100+ lines isn't much."

You need to arrange how to optimize your product just before you submit it to an XML product feed or other feed visitors of your selection. Investigation for the key words connected to your item that your clients use most routinely, and also design your search engine optimization strategy accordingly. Use convincing names and also descriptions for your items, and also provide radiant consumer assessments concerning them; you'll be shocked at the power of "objective" write-ups.

To make things easier for consumers to have a look at through millions of goods, the Google data feed has dropdown buttons, such as Product Type, that categorize products. Do not fail to remember to enhance your items based on these groups as well; add Universal Product Codes (UPCs) so that consumers can compare your item with quite similar ones. You may customize your items' qualities to make them attract attention lots more.

Look at how Google data feeds make a distinction to your bottom line by checking and also contrasting product website traffic prior to as well as after you executed your feed management technique. If your approach isn't performing as hoped, you have to either revise it or craft yet another approach entirely.
