Mesothelioma--an Early Diagnosis Can Lead to a Better Prognosis by [Gissing Thompson](#)

Article published on January 27th 2012 | [Law](#)

Mesothelioma can take from a quarter to almost half of a person's life to develop. Because of this great latency period, treating mesothelioma is difficult. However, there is hope in recent advancements in research and clinical testing. Medical treatment options for this illness now include chemotherapy, radiation, and surgery. Most patients choose a combination of these processes in order to extend their life expectancy. The prognosis for sufferers is also improved through healthy dieting, regular exercise and a variety of alternative therapies. The prognosis for malignant mesothelioma is unfavorable. But great efforts are being made by medical researchers to increase the life expectancy and survival rates of sufferers. Nevertheless, it is important to detect the cancer early in order to begin treatment as soon as possible.

The early diagnosis of mesothelioma is essential to the prognosis and treatment options. If a patient has had a previous history of exposure to asbestos, then the physician should be notified. Early diagnosis is the best means of receiving the best prognosis. Diagnosis of mesothelioma in its later stages has been linked with shorter life expectancies for patients. Mesothelioma in its advanced stages lowers the life expectancy of the patient to between one to two years after the diagnosis. That is why it is important to diagnose the cancer early, so that treatment can begin sooner, and the person has a better chance of living longer.

A diagnosis of mesothelioma usually happens within six months after a patient visits their doctor with symptoms. The first step is to give an accurate and complete history of all medical problems, including current health issues and past health issues. It is also necessary to give a detailed description of the patient's current symptoms. At this stage, it is critical to mention any asbestos exposure that the patient may have encountered in the past. If the doctor is aware that such exposure has occurred, he or she can be sure to consider the possibility of a disease related to asbestos - and this can expedite a diagnosis.

Persons suffering from mesothelioma have almost exclusively been exposed to asbestos either in the workplace or through the use of household items that contain the hazardous mineral. Indeed, asbestos is the only known cause of mesothelioma; researchers have found no other cause of the cancer. In many cases the victim was exposed to asbestos because employers were negligent in providing a safe and healthy environment for the person to work in.

Medical bills and other costs relate to this cancer can be crushing. However, there are legal options available for mesothelioma victims to help achieve just compensation. A Mesothelioma Lawyer South Carolina or a Mesothelioma Lawyer Georgia can help patients understand the legal procedures required to pursue a civil suit. Even in the case of patients who have died before the legal proceeding are concluded, the lawsuit can be pursued as a wrongful death suit. Persons in this position can be assured that justice will be done - even if they do not live to see it.
