How to Keep Your Bank Loan Interest Rate Down by [Tyler](#)

Article published on March 20th 2012 | [Loans](#)

In this day and age, it is common to find people getting bank loans in order to fund huge transactions such as buying houses or to make other high-value investments. When trying to get this kind of loan, there are many things that usually have to be taken into consideration when applying for the loan. These include the amount of money that one needs to borrow as well as how long they think that they will take to repay the loan. Most of these things usually affect the interest rate you would have to pay for this kind of loan.

The interest rate on a loan is one of the most important things that one would need to think about when trying to get a loan, since it can be thought of as the cost of getting the loan. Just as when buying other goods and services, it is often a good idea for lenders to try and get the lowest bank interest rates that they can find on such loans. In order to do so, you have to know of some of the variables that affect bank interest rates and how you can manipulate some of these to your advantage.

One of the major determinants of bank interest rates payable on bank loans is the amount of money borrowed. Most financial institutions have tiered interest rates on the loans, which means that you get to pay more as you increase the amount of money you borrow. This means that one of the most effective ways of reducing the interest payable on any kind of loans is to try and minimize the amount you need to borrow in the first place. There are various ways of doing this, and knowing of some of these methods can save you a lot of money in interest.

For instance, when you need some money to set up a business, it may be a better idea to start up the business in stages rather than doing everything at once. This way, you would need much less money to start up the business, and this translates to a lower interest rate from your lender. Once you have the basics of the business set up, you can then keep advancing your business slowly, using the profits that you make to invest more into the business. This is a very good way of minimizing your risk exposure when making any kind of investment, but few people utilize it since they may want to get everything running quickly.

The other method of reducing the amount of money you need to borrow is by finding other sources of income to support part of your budget. For instance, if you have several cars and need to buy another house, you can simply sell off some of the cars that you do not need and then use the money you get to cover part of the cost of buying the house. This way, you would need to borrow less, which will in turn lead to lower interest rates.
