The extraordinary luxurious terra cotta tiles are very strong enough by [Brijesh](#)

Article published on July 19th 2012 | [Marketing](#)

There are extraordinary luxurious tiles named terra cotta tiles made up of with the natural white clay that is found only in Italy. The "Terra Cotta" is an Italian word whose meaning is "Baked Earth" the tile that looks like about 100 years old and this is purely handmade tile. The texture of this tile looks antique. Many people asked over the years why there are no reclaimed terra cotta tiles. The Terracotta tiles have been used throughout the history for designing sculpture and pottery as well as bricks and roofs. In older days the terracotta tiles were very soft. This is because they were made up of very soft porous clay this is the clay that is prone to breakable.

These tiles were not durable according to various formal industrialists who are engaged in manufacturing terra cotta tiles. In the ancient time, the first terra cotta tile was made in the form of sculpture that was dried into the sunlight after being formed. There were no kilns in ancient times so the people of older times manufacture these tiles with their hands and use the natural process to make the tiles. Later on, they were placed into the ashes of hearth to harden and then the kilns came into use. This is the process uses into the factories today to fire the fireclay bricks to make them harden into the high temperature.

Only after firing into the high temperature of about 1000 to 1100 degree Celsius, the ceramic terracotta tiles are being very strong enough to be used for flooring. The main problem with the terracotta tiles is that they were not durable and strong enough too. These tiles pass from the gas kilns that leave the tiles one single color. In the wooden kiln, the tiles can come out from them in multicolor. These tiles were prone to breakage and high maintenance required over the years. Many complaints of the customers over phone were attended by the companies which manufactures these tiles.

The tiles simply got chipped off and broken that leave no chance of repair. These tiles were too soft and poorly manufactured on the plant in most cases. Apart from terracotta tiles, there are also Mexican San Felipe and Fleur De Lis tiles pass from the same process as the terracotta tiles do. Today the wooden burning kilns are using to create the multicolored tiles and fireclay bricks again after the centuries ago.

The terracotta tiles can be used for kitchen flooring and other backyard flooring due to its great natural texture and its no-slip quality. Other types of tiles are more likely to get slipped after getting the surface wet. Also the cleaning of floor of terracotta tiles is so easy. When setting of the terracotta tiles, the builders always suggest the home owners to apply the water-based terracotta tile sealer in order to lock its texture and color for several years. This doesn't emit any smell or odor as in the case of various other sealers.

When it comes to maintenance and protection of terracotta tiles on floor, the terracotta tile sealer serves to protect them from harmful gasses and the liquid agents like oil, water and grease. Terracotta is a porous substance that once penetrated can lead to the reduction in the quality of it. Sealing of terracotta ensures the preservation of both quality and texture of terracotta tiles. There are several varieties of sealers out of which the topical, penetrating, impregnating and the water based sealers are widely used. A topical sealer is typically based on the polyurethane or acrylics and it tends to be exposed of wear easily. This is effective to stop stains but it doesn't prevent from other issues.

Secondly on the other hand, the penetrating terracotta tiles sealer works on the different issues other than topical sealer and this can be water and acrylic based. This works on penetrating the

terracotta tile surface deep enough to anchor it. Moreover, the penetrating tile sealer is capable to solve most of the problems that topical sealer can't. However, the penetrating terracotta tile sealer is not being capable to cover and prevent the tile from salt attack issues like efflorescence and spall.

Next up, let's go for the impregnating tile sealer. This is perhaps to be the best option because it is capable to penetrate deeply the substance enough to provide the protection that others do not. This works on the same way as the penetrating sealer does but the main and only difference is being the depth of penetration.

And lastly there is water-based tile sealer that is typically much better than acrylic based sealers because they protect the surface faster and they are eco-friendly too. There are Volatile Organic Compounds (VOC) make the water based sealers perfect choice. Terracotta tiles can live longer if they are under protection of terracotta sealing which requires proper attention and consideration.

If you want to have terracotta tiles for a cost-effective project or for flooring at your own home or office, Tileofluxury.com offers the original terracotta tiles and other fireclay designer tiles. They offers Riviera pattern of tiles and they have worked for various projects. Ashley Neal Texas is the founder and owner of Tileofluxury.com. Ashley and Julia Neal founded this company in 2004. They sell their worldwide including France, Italy, Spain and Mexico. They got special training in Italy of antique sealing of Italian terracotta tiles.

They are one of the leading manufacturers of terracotta tiles in USA today.
