How to Choose a Sound Bar by [James](#)

Article published on February 24th 2012 | [Music](#)

If you are interested in getting a dynamic sound quality from your TV and the traditional surround sound system do not satisfy you, you can go for a sound bar. These are single speaker systems that require minimum space and wiring. These systems are also known for offering better sound quality with your favorite TV shows. The bars are especially good for flat panel TVs and can provide much better sound than the small speakers which are built inside the sets themselves. The design of the bars is such that they can easily match the latest plasma and LCD televisions in appearance. Though the sound bars cannot deliver the same sonic realism as a full surround system, still they are the best option for a small viewing room..

The first thing to be considered is that whether you want a stereo or a surround sound. There are some sound bars which have built-in amplification and can provide good stereo sound, while there are others which can provide appreciable surround effect. The bars can be broadly classified into two categories, bars with virtual surround sound and bars that work as a part of the full surround system. You have to consider the amplification factors as well which are again divided into powered and passive bars. The next factor to be considered is the size of the room where you are placing the bar. For larger rooms, the bars have to be larger and more powerful while for small and medium sized rooms, the systems are just the normal ones. The systems should have the presence of all sorts of audio inputs and subwoofer systems. Some other additional features which you have to look after are the presence of video switching, DVD playback, satellite readiness, iPod compatibility, multiband remote and much more. You should also follow certain precautions while placing the bars.
