Gone are the days when a battalion of men are appointed as securities to guard a bank or a villa or any place with expensive things in them. The problem of affordability is not there any longer. Be a rich or middle class person, anyone can afford to have a home security nowadays with the advancement of the technology. Security systems have become mandatory for every household nowadays, they are not just for preserving valuables but they are also used as alarm systems that give warning about an eminent danger so that people can take necessary precautions. Thus, security system is not only for preserving valuables but also for protecting lives.

Having a security system at home like the ADT Home Security, gives a lot of peace of mind for people. A person need not worry about his valuables when he is at work or on a vacation. People living alone at home can go to sleep without any fear knowing for a fact that their alarm systems will start ringing if there is an intruder in the home. There are alarm systems that cater to all groups of people. There are reasonable sturdy systems to expensive sophisticated ones. So it does not mean cheap systems are not as secure as the expensive systems, it all depends on the type of system that is required. Now, people can choose their systems according to their budget. Businesses like banking and jewelry retails need to invest on good security systems, to keep their businesses safe and secure.

There are three major types of security systems for homes: indoor security system, outdoor security system and monitored home alarm systems. The indoor security system is the most common type of security system used at homes. People, who have this type of system, will have the necessary equipment installed on the doors and windows. The equipment contains motion sensors and alarms which senses movement that comes near their vicinity, once this is detected then the alarm is immediately triggered. This alarm starts to ring which alerts the owners about the possible intruders. There are different options with indoor security system. They can be activated 24\*7 or they can be activated during the odd hours or if the entire family is not at home.

The outdoor security systems are those placed near the gates or the entrance of the homes. These security systems help in monitoring movement outside homes. They trigger the alarm or even turn on the lights of the grounds if there are any suspicious movements on the home grounds. This reduces the possibility of burglars around the house. Monitor systems outside homes also help in seeing who the visitor is without opening the door, so there will not be nasty surprises for the owner if he opens without knowing who is there on the other end and thus he control people coming and going out of the house.

Monitored home alarm systems are probably the most expensive of all security systems as the technology used for this is more advanced. Not only the equipment is expensive but also man resources have to be used to monitor the systems. When the alarm is triggered, it usually bleeps in the remote monitoring station which is usually managed by the appointed person who then reports about the alarm to the officials, this is not only expensive but also an effective form of security system.

Thus, security systems have developed with the advancement of technology. Earlier it used to be locks, then security numbers came now people can use their thumb print their eye ball scan as codes to secure instead of password. What advanced technology will come to replace this in the future?
