Using Aerial Photography services by [Mary Porter](#)

Article published on June 21st 2012 | [Photography](#)

Aerial photography is a great way to capture images of places from above the ground. There are lots of different needs for Aerial Photography and WMS and many different industries utilise this form of photography for their work. Some people also enjoy aerial photography as a hobby and will like to have aerial photography pictures in their homes. Aerial photography has been used for many years in the UK and it provides an invaluable source for capturing non-invasive and large scale pictures of the UK. Aerial photography pictures are used by archaeologists to look at land structures and changes in land over the years. They are used for large scale surveys and assessments of areas, they can be used to help with planning for large scale building projects, they are used to create maps and for many other purposes.

Aerial photography today is carried out using the latest digital camera technology and this provides very high quality vertical images at a high resolution. Some companies that provide aerial photography services will offer a UK wide coverage and others will only work in specific parts of the UK. Aircrafts are used to in aerial photography and some companies will have access to a wide resource of various aircrafts for wider coverage. Helicopters are used in aerial photography as they can be more flexible in terms of where they can fly. There are two kinds of aerial photography and these are vertical aerial photography and oblique aerial photography. Vertical aerial photography is where a camera is fixed to an aircraft and it will fly at a fixed height to capture images. In oblique aerial photography a hand held camera is used to capture images of places that are flown over.

Web map service or WMS as it is known is a standard protocol for the delivery of geospatial data to GIS software, design packages and web interfaces. WMS makes aerial photography images easy to manage and easy to access through online sources. To use a WMS you simply need to enter a URL into the software package that you are using and the images you want will be displayed for you. WMS makes imagery much easier to sort and view as it allows users to look at specific parts of images rather than having to look through lots of images to find the specific part they want to view.
