Boost Your Call Center Advantage with CRM Software by [Noreen Clay](#)

Article published on May 17th 2012 | [Software](#)

The busy voices in a call center may just be plain noise to some, but they are music to a call center manager's ears. To him, the busy voices are a symphony of productivity, effectiveness, and customer satisfaction. CRM software specially designed for the call center industry makes all of this possible.

Whether a call center focuses on outbound or inbound calls, it needs to handle a large volume of calls simultaneously. Callers want fast and accurate responses and results, whether they're calling about a purchase, a tech support inquiry, or an update on a credit application. Respondents must then be able to forward these inquiries to the appropriate agent immediately. The volume of these calls can be overwhelming, thus the need for a highly capable CRM software.

A properly-selected and effectively implemented CRM software allows a call center to better leverage its existing agents. This is possible through better resource allocation, real-time performance management, effective scheduling and skills-based assignments. Depending on your company's needs, the CRM software may include speech recognition, interactive voice response, call recording and monitoring, and predictive dialing, among other things. But no matter how your CRM is configured, there a number of things you need to consider before you purchase such software.

## Basic Features

The most important CRM software features you need to consider are: routing, automatic call distribution, and reporting. These are the areas of a CRM software that you will need to test thoroughly during your selection process. CRM software also needs to be highly customizable so you can create reports the way you want, rather than force them into pre-configured templates.

## Additional Features

Aside from flexibility, you also need to check if the software has advanced automatic call distribution that forwards the calls to another team if one group is unavailable. This will decrease hold time and add to customer satisfaction. Since call centers have a high employee turnover ratio, a call center CRM software needs to be easy to learn and use.

Automated voice response systems can also be advantageous. They eliminate the need for human response, which can save you a lot on manpower costs. Some automated solutions collect caller information while they wait for a live agent, while others can address issues fully via interactive voice response. Check to see if your CRM call center software candidate provides this feature.

With the number of call center software choices you have, you're bound to find one that's a perfect fit for your company. To learn how your company can benefit from CRM software, just visit [crmsearch.com/call-center-crm.php](http://crmsearch.com/call-center-crm.php).
