Enthusiastic Smart Use of Resource Management Software to Increase Staff Efficiency by [David Hog](#)

Article published on November 30th 2011 | [Software](#)

Many companies from a variety of sectors will benefit from the use of Resource Management Software to increase staff efficiency. Great programs have certain capabilities, which help managers to identify staffing inefficiencies. By improving the efficiency of both managers and employees, computer programs may open the door to increased productivity, and increased revenue.

Good software has an excellent set of features. The best programs have an easy-to-use setup wizard, to make the initial use of the program both simple and fast. The best programs also track multiple employee information sets, including availability, skill level, departments, and personal information. Additionally, the best programs provide reporting capabilities, which help schedulers to analyse trends in employee behaviour.

Computer programs help schedulers to identify potential problems, before they happen. For instance, a manager in a large bookstore with a cafe, when inputting employee information into a new software program, may discover how few of her employees are actually capable of working in the cafe. A shortage of trained workers will lead to a bottleneck in the cafe during busy hours, which will lead to lost revenue.

A scheduling program may improve manager efficiency. When the scheduling manager for a business spends less time producing a schedule, because the computer program automatically fills in shifts, then the manager will devote more time to revenue-generating activity. A manager may provide coaching to employees, serve customers, or complete an outstanding project, instead of endlessly poring over schedule spread sheets.

A software program may help employees to become more efficient. Good programs will sort job assignments according to employee skill level, placing the most efficient person in each available position. The right person, in the right place, at the right time, will improve both productivity and customer service.

Businesses should examine their needs before choosing a scheduling program. Businesses may have a few personnel, or a large staff; businesses may have one location, or multiple locations. Programs which auto-generate employee shifts save the most time. Also, programs which produce easy-to-understand reporting help managers to spot trends quickly, so that they may address potential issues.

Many managers are reluctant to try the use of Resource Management Software to increase staff efficiency. Managers may be comfortable with their established routine, or may fear that part of their job is being taken away from them. However, once managers see how computer programs save time, create efficiencies, and allow staff to work closer to the revenue line, even the most stubborn among them may become converts.
