Four challenges to overcome during mobile website development by [Angel](#)

Article published on January 25th 2012 | [Software](#)

Mobile phones have become a robust tool to browse the internet and to gain information at quick pace. With this splendid opportunity created by mobile phones, companies are trying to build effective mobile sites by way of mobile website development to lure the attention of end users. The developer or the company involved in this website development program has to overcome some obstacles that can hinder the program. What are the challenges that need to be overcome during this development program?

Small screen size

The enthusiastic developer who participates in the development program that intends to build effective mobile websites faces problems owing to the small screen size. To overcome this problem created by the small screen size, and to make sure that the developed site fits well into that of the mobile phone display, the layout has to be uncomplicated. The developer should provide his focal attention to develop a mobile site that comes with an uncluttered look, and should make sure to make diligent use of pixels and width when the site gets built.

Easy navigation

When it comes to mobile website development program, it differs from the program intended to build normal websites, where navigation menu may not be a wise inclusion in case of mobile websites. In essence, the developer who is involved in this program to develop mobile sites should ensure that the site that is built offers easy navigation for mobile phone users. When navigation is made easy, the mobile site becomes a smashing hit amid end users.

Good speed

Another significant aspect that could produce a negative impact on a mobile site comes through the form of speed with which the site functions. The developer involved in this process of developing sites for Smartphone should ensure that the mobile site functions with good speed, where the developer should cut down all the features that can reduce the speed of the site. Moreover, the site developed for Smartphone should take the visitor to the normal site when information is not readily available at the mobile site, and when certain information is available only in the normal website pertaining to an organization.

Perfect for devices

Most importantly, the developer who is involved in this development process should build sites that suit specific devices. This could cause problems, where the developed sites cannot function efficiently on all types of mobile devices. With mobile devices getting introduced with each passing day, the developer should make sure that the website is built for specific mobile phones.

The company that is involved in the mobile website development program should adopt effective strategies to overcome the obstacles and establish good results out of this program.
