Infections in any PC are great threat for any PC. However the foremost in all infections is a virus which has instigated with the beginning of computer system and in particular in late 80s. This is one of the hottest issues which software industry faces. A virus is also the mightiest cause creating a slow PC and slow Internet connection.

Viruses are one of the most probable causes producing loads of problems such as a slow PC, freezing, BSOD, alarming pop ups and many more identical issues. These are superfluous entries but always there in your PC. To throw away any virus yourself is actually a complicated task so keep your antivirus well-run.

A virus is a small computer program, when it runs, at the same time it loads itself into the memory and carries out the instructions programmed by its author. The characterization of a virus can be done in this way: -

It is a computer program that can pollute/ contaminate a different computer programs by dangerously damaging or altering it, and which can make a replica itself.

The actual name for viruses is self-propagating code, but by likeness with the field of medicine, the name "virus" has been given to it.

The after effects or belongings of a virus may fall from simply a slow PC issue, computer hangs, BSOD, freezing various bad consequences and error messages on the screen to clearing out data, which is the chiefly grave sort of virus there is. As there is a extensive range of viruses with broadly varied effects, viruses are not classified supported on what kind of demolish up they do, but on how they multiply and infect computers.

Due to some specific reasons, the Viruses can be divided into-

Another form of infection or virus is Worms are also very dangerous viruses which can multiply over a network connection. And can generate countless issues including slow down network, smash up data, creating slow PC problem etc.

Here another category of the computer infection is Trojan horses; they are also very treacherous viruses which construct a security hole in the computer (usually for their designer to gain opening to the pass on a disease to system and takes control over it). Here a firewall plays an important role to stop creating any security hole in any port of the system.

Logic bombs are another type of viruses which can produce on a specific event such as the system's date, or remote activation process etc.

A new occurrence has come up in the recent past few times, it is of hoaxes that is notices received generally by e-mails for example a report on the look of a new critical virus or a chance to win a free devices) together with a note telling the recipient to forward the message to everybody he or she knows. The whole goal of this is to clog network traffic and multiply misinformation.

Solution- even though an antivirus is the official resolution for a Virus, but a lot of times just an antivirus does not help to sort out or remove the virus from the system. Manual get in the way or

manual efforts are essential to fix virus for a time. One of the huge difficulties whereas fixing a virus manually is to construct compulsory changes in PC's registry.
