Mobile Application Development Related to Different Platforms by [Elan Technologies]

Article published on January 30th 2012 | [Software]

iPhone Application Development: Apple's iPhone 4S is one hell of a smartphone device and based on one of the sleekest and the slickest mobile operating system. It is way ahead in terms of incorporating new features than any of its competitors. There are some features which deserve a mention here. They are Face time, dual cameras, multitasking features, HD video recording, 8 MP cameras with the LED Flash functionality and Airplay.

iPad Application Development: You can get developers for creating high quality apps for the iPad. The iPad is a revolutionary device and has signaled a new era in tablet computing. With its widescreen display and a plethora of features in it, there are millions of users now worldwide.

Some of the features that the iPad consist of include a 9.7 inches screen, multi-touch, HD graphics, Long battery life, Third Party support apps, HTML 5 apps, extra swift A4 chip and accelerometer.

Blackberry Application Development: The Blackberry mobile requires smarter mobile app development than any of the other smartphones. RIM's Blackberry is a fantastic business smartphone which has great messaging features other than its email based apps. It has features like data handling, security, robustness in features and hardware, and multitasking functionality.

The Blackberry actually provides a fantastic platform for mobile app developments in different domains including multimedia, entertainment and business.

There is stiff competition from different mobile companies. But Blackberry has managed to hold its own due to its unique software and hardware functions.

Windows Mobile Application Development: The Windows mobile OS which is developed by Microsoft is perfect for those users who want to carry the same look and feel of the Office applications to the mobile. It is a good platform for PDAs, smartphones and some other mobile devices.

Some of the highlights of the mobile operating system include multitasking ability, Microsoft based applications support, support for IE browser, and Bluetooth connectivity.

Symbian Application Development: The Symbian OS is the flagship platform for Nokia which has immense flexibility in design and user interface. Symbian has been utilized by different companies for their smartphones including Sony Ericsson, Siemens etc.

Salient features of the platform are its messaging features, Interoperability, multi-tasking, robust design and security.

Android Application Development: The ever rising popularity of Android applications has boosted its mobile app development. Its features have been incremental with the versions that it produced. The apps are based on the Java programming language and since it is open source it can extend towards new technologies. The apps are then uploaded to the Android App Store.
