Salesforce data migration: ensures organized data integration solution by [Andy Robert](#)

Article published on March 15th 2012 | [Software](#)

Data integration solution in any organization provides the platform of collecting, refining and using the data to make meaningful business decision. This solution contains different key competencies, which involve data synchronization, data replication, data quality and data loading.

Since our dependency on computer system is going up day by day, thus, finding different web based solutions have become one of the most important tasks. People have started relying on several software tools to conduct various operational and administrative tasks, so that the entire process can minimize the operational expenses. And, this approach can really improve the overall efficiency of the organization.

As long as the word â€˜softwareâ€™ is concerned, then we can see the existence of data in the business scenario. And, companies have become very much alert to make their database free from any error. This is where data integration solution comes into the picture as one of the most reliable and effective approach. With the help of these tools, different data are stored in a variety of formats and databases.

In case of Salesforce data migration, it helps provide an exceptional data integration solution for any company dealing with huge volume of data. It entails flawless data integration by minimizing the time required.

For any software as a service (SaaS) model, this kind of integration acts for the data synchronization between different business applications and storage sources. Many non-technical users can be benefit-ted with the help of data integration services over the web using the SaaS model.

Various subscription based data migration services are structured on the multi-tenant framework, which can ensure many organizations to maximize the value of the business data, without hassling the existing work process.

Upon using effective Salesforce data migration, different companies would be able to synchronize accounts and contacts in less time, which work in contrast to the conventional methods. It allows users manage new orders and data, required for integrated reporting and analysis. Moreover, the entire process is based on the SaaS model and thus, numerous examples of on-demand applications can be used separately for administrators and non-technical line of business managers.

This integration solution helps remove erroneous and duplicate entries. It helps simplify the process of migrating, cleansing, replicating and synchronizing data across several business applications, master data hubs and databases by using effective mapping and data transformation tool. This application helps explore different application-level objects like, contacts, accounts, leads, opportunities, and customers through an easy to understand and clear graphical user interface.
