SharePoint Make use of Features of IIS and an ASP.NET Technology Important in SharePoint Development by [Jakeemcarr](#)

Article published on August 23rd 2012 | [Software](#)

SharePoint is widely utilized by means of a huge numbers of users, companies as well as programmers and consist several architectures. This effective platform is put into use as a portal server which have content management program, workflow host, data store, delegated administration, an intranet os, a Business Intelligence (BI) application kit, groupware application kit, services host, and pertaining to user interfaces (UIs) for a processing layer as well as data.

There are many features as well as features of popular SharePoint development framework. In this content we summarize pertaining to a number of attributes of IIS and ASP.NET technological know-how used simply by SharePoint. Within this write-up, we speak about some identical functions involving these two technologies although there are several significant difference amongst SharePoint as well as ASP.NET. For effective SharePoint development, programmer demands in-depth familiarity with SharePoint along with its beneficial development capabilities.

Active pages having aspx documents - The active pages associated with ASP.NET are generally introduced as aspx files. Pages of SharePoint are actually ASP.NET pages. By using a registered "SharePoint" prefix its handles are really recommended within the page markup. If not really wanted specific setting intended for compile, in ASP.NET, a web page is usually compiled merely the first time through the standard web page parser. Hence SharePoint website's customized web pages are placed inside the content data bank involving SharePoint so when web pages are used, they aren't compiled. SharePoint utilize a professional virtual path provider which in turn is an internal class with name 'SPVirtualPathProvider' which often is taken from 'VirtualPathProvider'. To choose required page in the document structure or perhaps content material database as well as load this, it makes use of this kind of virtual path.

Ascx documents are generally with regard to user control.

The master and also content pages are comprises by SharePoint.

Web services - Some of SharePoint web solutions are applied as ASP.NET ASMX services.

Web Parts is an various other approach which usually is captured through ASP.NET. In some occasions, the original SharePoint impersonation is useful selection perhaps even simply by SharePoint developer make use of the ASP.NET version. For cellular phones the SharePoint UI also make use of the thought of ASP.NET of authorized Web Part adapters. Having using ASP.NET user controls, a number of SharePoint web controls and also web parts are designed.

Virtual Directories - In the SharePoint root, SharePoint maps many virtual directories in every IIS website to physical directory. Title of the directory is actually '%ProgramFiles%Common FilesMicrosoft Sharedweb server extensions14'. A SharePoint Developer require web program having required document, images and also source file, they become save within the proper physical folder of the particular front-end's web servers. While using the SharePoint's option deployment procedure, this procedure is usually handled easily.

SharePoint Development Company selecting SharePoint developers having knowledge of ASP.NET is an additional advantage. Nevertheless, the experience regarding SharePoint development is different from the ASP.NET in many ways. There are own model of SharePoint regarding deployment along with installation which come to be beneficial to learn for SharePoint developer.

ASP.NET is unfamiliar regarding a difference amongst the application web pages as well as site web pages and so in SharePoint. In addition, SharePoint developer may customize web.config data files utilizing system of SharePoint. In SharePoint, the ASP.NET personnel approach product is greatly improved.
