Getting Contracts with Cloud Hosting Providers by [John W. White](#)

Article published on June 1st 2012 | [Technology](#)

As technology continues to advance, more businesses are turning to the virtual world to provide support for their businesses. When they obtain contracts with cloud hosting providers, businesses quickly realize that using the cloud for storage and work makes a great deal of sense. When they use cloud computing companies, businesses do not have to worry about backing up data or finding the space and power to provide large servers on their own properties. However, businesses who decide to use a cloud provider for their data should pursue contracts that allow them enough usage for their operations as well as fair policies.

When getting contracts with cloud computing providers, businesses must ensure they understand what the cloud computing companies' contract is offering. Some online cloud storage contracts do not offer any service guarantees or warranties. While these packages might seem beneficial because of their low cost, they are often poor because they leave the business owner without recourse if something unforeseen should happen.

Another contractual issue that small businesses should look into when contracting with cloud providers is the legality. When information is placed in the cloud, who owns it and who can modify it? Who has legal rights to it, and who is penalized if illegal material is stored in the cloud? All of these issues are ones that businesses seeking cloud computing contracts should consider.

As technology continues to advance, cloud storage and other cloud computing services are becoming more and more popular among businesses of all sizes. However, getting beneficial contracts with cloud hosting providers is not always easy. Individuals can learn more about cloud hosting and the different packages at gnax.net.

About GNAX With over 10 years as an industry leader in the southeast, Global Net Access (GNAX) operates two world-class data centers, AtlantaNAP and DallasNAP, offering mission-critical data center colocation and cloud services. GNAX provides superior technology solutions to a variety of organizations and industries worldwide. Privately held with headquarters in Atlanta, GA, GNAX was founded in 1999 and has retained net income profitability since 2003.
