Getting the Right Heavy Duty Casters by [James Blee](#)

Article published on August 21st 2012 | [Technology](#)

Over the years caster wheels have been used extensively in the industries when it comes to heavy duty. The reason is the reliability and strength that these wheels offer to the structure. If you are about to install the same into your industry or factory, there are no formulas for doing the same. However taking the help of an expert in the field can be pretty effective. The wheel application guide can also help you a lot in this aspect. In order to extract the best from your heavy duty caster wheels one needs to understand the need of their respective market and factory. Getting the right caster and the right combination is another very important factor for the same. Once you are done with the same, regular inspection and maintenance would enhance their life. In order to understand which kind of caster would fit in perfectly, one needs to consider the total weight of the equipment along with the maximum expected weight. The equation is pretty simple, higher is the weight larger should be the wheels so that the weights are distributed equally and it is easier to move them around.

It is again essential to choose such heavy duty casters that have higher per wheel capacity that what your system is expected to come up with. There are of course other factors that one needs to have a close look at such as the type of floor in use and the braking that is required. The engineering department can help you out with such decisions. In the industries where the heaviest of loads are expected the most common caster in use is the drop forged caster with double ball bearings. In case you are looking of institutional purpose then the medium or light weight casters can be more than useful for you. Proper maintenance and regular inspections would ensure that the casters keep on working for a longer period of time.
