Hydraulic System – Precautionary Measures [James Blee](#)

Article published on June 4th 2012 | [Technology](#)

Before purchasing a hydraulic system, it is always important to know about its inner as well outer anatomy. This will help in measuring its performance later on. Also it should be noted that these devices need to be handled with care. A little bit of careless or rough usage can lead to deteriorating on their life span or longevity.

Have a look at different reasons that can result in deterioration in longevity.

A very common reason that can be held responsible for deterioration of hydraulic system is fluid contamination. The hydraulic system design can be held responsible for such a situation. Inappropriate efforts to remove contaminants from the fluid can result into a critical situation. Such a scenario can also take place when lethargy is shown in replacing old hydraulic fluid with new one for a longer time range. In most cases, contaminants start to enter hydraulic tanks in the form of dust. These dusts are formed through metal and rubber containments. Entrapped air and water also results in contaminating fluids. It is recommended to carry out regular inspection of fluid samples to maintain the cleanliness of hydraulic fluid.

Often fluid contamination is termed as "additive deterioration". It is because additives are the major source that provides oil with specific characteristics. As these additives are highly vulnerable to physical as well chemical changes, deterioration of them can lead to certain fluid breakdown. Fluid deterioration can also result because of extreme high temperature. Therefore, it is always advised to maintain the fluid controlling temperature and that should not be higher than sixty degree Celsius. These days, a lot of hydraulic units are bundled with heat changers, as well temperature controlling pads.

Keep in mind that it is extremely important to carry out proper evaluation of the contaminants as well the originating source. This will result in taking the necessary steps to prevent spreading of such contamination in the near future.
