Identifying Two Vital Blackberry Systems Crafted for Business Owners by [Kelly Brueggemann](#)

Article published on July 17th 2012 | [Technology](#)

You could just have to remember two details regarding BB: BES and BIS. The BIS and BES pass information via a secure link. Needless to say, learning the difference of the BIS and BES is a key topic, and a topic that deserves a discussion.

BES is short for Blackberry Enterprise Server. With it, a BB cellphone could access a business intranet. This internal connection is made for use by the corporation you work for, that means that any internal connection is exclusive and in-house. Imagine it like a micro network which is cut off from the rest of the Internet. Naturally, internal connections could access the Internet as well, when specific tiers of protection are integrated into it.

BIS means BB Internet Service. A BB Internet Service enables a Blackberry to obtain access to the Internet. Consider it like the ISP exclusively built for any BB cellphone instead of a personal computer. Unless you are using BB Enterprise Server, BIS is the system your phone employs to log on to a webpage.

As aforesaid, the BIS and BES permit your BB cell phone to send electronic mail as well as use alternative programs. Everything you work on your BB mobile phone goes to a BES/BIS application; it's the task of any BIS or BES to interact with the globe on your behalf. Simply, the distinction between the two is the quality of security and operation and the system operator you end up.

With respect to your BES, it is your employer which operates the host. Firms generally have their BES system nestled in a place inside their commercial connection. The IT office can manage every aspect of a server. Nevertheless, Blackberry Enterprise Server licenses would still need to be purchased courtesy of the seller.

For any Blackberry Internet Service, the seller operates the system. All the details about your Blackberry Internet Service are secured; but that is pretty much all the security you may have. Any provider may decide what services to work in any Blackberry cellphone; yet you possess the choice regarding what Blackberry Enterprise Server CALs to acquire.

What both the BES and BIS boil down to is safety. By using any BIS, many things regarding your smart phone work in the universal connection. Even if data is secured, you're still online; therefore, the possibility of a person intercepting any files is greatly larger. With any BES, the information can remain at an exclusive system. A thing to bear in mind: always buy Blackberry Enterprise Server (BES) CALs from a reputable dealer. Learn more regarding BES licenses on the discussion boards on the following webpage: blackberryforums.com/bes-admin-corner/114519-bes-cals.html.
