The BlackBerry Enterprise Server Express: a Thorough Q&A by [Samantha Cole](#)

Article published on May 16th 2012 | [Technology](#)

The corporate environment is growing to be more aggressive, and in order to make it in this ruthless environment, you must be able to compete at the same level with the other businesses in the industry. Accessing your work whenever, wherever you are, can help you. Luckily for you, BlackBerry is here to enable you to do simply that.

The Enterprise Server is a software package provided by BlackBerry that allows for the employees of big companies to get their work files, emails, and other work-related applications from their BlackBerry phones. This software is attached to other messaging and collaboration software such as various Microsoft applications or the Lotus Domino Server. This enables personnel that are out of the office to manage their emails, book appointments, edit files, and utilize business applications. Not a lot of companies are able to afford this software though, which explains why BlackBerry unveiled the Enterprise Server Express for small enterprises.

What does this mean for owners of small businesses?

The Enterprise Server Express is simply designed to be the original Enterprise server's smaller version. It is developed on a similar program, and has most of the same features and functions. The principal difference between the two is the price. Furthermore, the Express version has fewer client access licenses, which refers to the number of people that can use the software.

What applications are supported by the Express version?

It may be far simpler to figure out what applications aren't backed up by the Express version than those that it does assist. A number of premium applications that exist only in the full version, like Enterprise Instant Messaging Clients, BlackBerry Mobile Voice System, and Chalk Pushast software, aren't backed up by the Express version. Besides these, you can do just about anything.

What do I acquire?

When you obtain this software from a dependable seller, the usual number of server CALs you obtain would be 75, which signifies that 75 individuals can work with the software once it has been installed. You can also decide to include another 75 to this number if you wish. All you need to do is give a few bucks along with your original purchase.

How does it benefit IT administrators?

Your company's IT department will also be happy to learn that they can also get over 35 IT controls and policies. With these, they can connect to a server client access license and wipe the phone from another location, or reset the passwords. The first version offers approximately 400 IT controls and policies.

You'll need a reliable server with satisfactory server CAL capacity of your company, so why don't you utilize this?
