What Automated Trading Means to the Novice Trader? by [Gecko Software](#)

Article published on December 20th 2011 | [Technology](#)

One of the best intimidating markets for the novice trader is the Forex Market. Foreign exchange systems could be very confusing to someone who does not have a lot of experience or training in the area, and they could generally have difficulty in making sense of all the facts required.

It is the case that over 90 percent of Forex traders lose cash during their first years in market, and even big investors in the market may find their gains wiped out by an unlucky trend-breaker, or an sudden shift within the pattern. However, more and more beginners to Forex training are beginning to use automated trading robots to help them get a grip on their markets and spot patterns and trends in time in making a sensible profit, and then sell before the trend falls again.

It may sound a little Science-fiction: an automated trading robot looks like something you might see in the long run, but you may put your hands on one now with Forex trading software that acts with intelligence to show you where you should invest your money and where you ought to sell your current stocks. Trading in Forex markets is not just about gaining more cash than you lose, and even with automated trading you can still lose, but it is also about making a career out of the market with steady investments that bring you sensible profits.

The Forex trading software can help you to invest correctly through a range of various methods. Firstly, it takes the trading reports which has occurred in the earlier weeks or months and begins to mark out the patterns from that period. It may call your attention to specific patterns, letting you choose whether to invest in that company or not, however providing you with a strong recommendation. With an automated trading robot, you do not even need to submit each trading bid to the market yourself. Rather, you can set up a technique, telling the robot what you need to trade, when to start out investing and when to pull out again. The robot takes all of this info, and then begins to scan the currencies you would prefer to bid on for worthwhile investments.

Using a robotic system like this implies that you don't have to spend hours in front of the computer daily checking your stocks and shares. Instead, you can just spend your time making sure that everything is running smoothly and fine-tuning your strategy to accommodate shifts in patterns of investment.
